Newhouse may be correct, but no sources available to him could have offered convincing proof that his *postulated* rough symmetry of super-power concern was indeed the case.[39] John Newhouse's ideology has been singled out for particular attention here, solely because his is the only publicly available, detailed study of the course of SALT I. In the interest of balance one cannot turn to an alternative, unfriendly history. *Cold Dawn* offers a mountain of fascinating fact that is not available elsewhere, but the reader must be warned that the book also contains a mountain of supposition—and, unlike the case of a work of scholarship, there is no way in which fact and fancy (or possible fact) can be checked independently by a reviewer.

Given the classified nature of the relevant documentation, and the nonattributable status of much private official revelation, it must be admitted that a scholarly work, with sources that may be checked independently, could not be written. It is a law of life that officials, among others, tend not to reveal information or attitudes that are likely to damage their place in historical appraisal. *Cold Dawn* was written from the point of view of the National Security Council system in Washington. Newhouse was denied effective access to the SALT delegation. The frustrations of the SALT delegation, in the context of Henry Kissinger's "back channel" SALT diplomacy via Ambassador Dobrynin, are not very sympathetically covered in *Cold Dawn.*[40] For an understanding of SALT from the perspective of the delegation, *Cold Dawn* needs to be supplemented by a reading of the articles that Paul Nitze has written since he resigned from the delegation in June 1974. Nitze was the senior representative of the Department of Defense on the delegation from the very first SALT session beginning in November 1969.[41]

From the SALT literature, three edited works endeavor to analyze the diverse implications of the SALT experience for a variety of strategic and political problem areas, and adequately represent the scope of the strategic debate. The works edited by Morton Kaplan and by William Kintner and Robert Pfaltzgraff tend to the orientation that security is a function of defense capabilities, while the work edited by Mason Willrich and John Rhinelander is more sympathetic to the view that security is best attained via arms control and arms reductions.[42] Although few edited works ever present clear collective messages, it is not unfair to state that the analysis in the works edited by Kaplan and by Kintner and Pfaltzgraff tends to be highly critical of the strategic

[35] Newhouse's former Brookings colleague, Morton Halperin, emerges as a heroic figure in the quest for arms control. Reference is made to Halperin's "sturdy arms control bias" (p. 112), to "his open aversion to ABM's in all forms" (p. 112), and to the fact that "arms control is his passion" (p. 50). Newhouse's robust, almost lyrical, approving prose suggests very strongly that arms control concern has transcended scholarly enquiry and has become ideology.

Clemens, Jr., *The Superpowers and Arms Control* (Lexington, Mass.: Lexington Books, 1973), pp. 35–36, 59–61; William R. Van Cleave, "Political and Negotiating Asymmetries: Insult in SALT I," in *Contrasting Approaches to Strategic Arms Control,* ed. Robert L. Pfaltzgraff, Jr. (Lexington, Mass.: Lexington Books, 1974), pp. 10–21; and Colin S. Gray, *The Soviet-American Arms Race,* chapter 3.

[40] See Alton Frye, "U.S. Decision Making for SALT," in Willrich and Rhinelander, p. 93. For a good example of possible (Kissinger's) image-damaging information not made available to Newhouse, see Clemens, pp. 43–44, fn.a.

[41] A fairly comprehensive statement of Paul Nitze's views on American SALT-related practices is "The Strategic Balance Between Hope And Skepticism," *Foreign Policy,* 17 (Winter 1974–75), 136–156.

[42] All three works are cited fully at the beginning of this article.

assumptions that guided American policy makers in their approach to SALT. The authors in the Willrich and Rhinelander volume tend to a more friendly analysis. Unfortunately, the two defense-oriented and highly critical works contain, with very few exceptions, analyses completed prior to the signing of the SALT I agreements on May 26th, 1972.

All three works attest to the renaissance of fundamental thinking on the frontiers of the sub-sub-discipline of strategic studies. In each book, authors question the orthodoxy that has been *de riguer* in the arms control citadels of the United States since the middle 1960s. Following on the protracted SALT experience, catalyzed by the need to sharpen analytical frameworks in order to cope better with SALT material, each work casts doubts upon the following beliefs: that mutual assured destruction is the final word on deterrence theory toward which all sophisticated strategic thinkers, of whatever national culture, must ultimately strain; that Soviet strategists either conceptualize in a fashion very similar to American strategists, or that such conceptualization may be induced as the product of American educational endeavor; that the nuclear arms race is driven essentially by an action-reaction mechanism between nation-states; and, finally, that arms control negotiations *are really about* the control of the arms race for mutual benefit.

With their firm adherence to the semi-organized arms control interest,[43] the contributors to the Willrich and Rhinelander work tend to be less thorough-going in their critique of the still-orthodox wisdom. With few exceptions, each contributor fairly frankly admits ignorance about the decision-processes and motives of the Soviet Union. The broad position of most of the authors about the soundness or unsoundness of the SALT I agreements is well known. In healthy contrast to John Newhouse, however, these authors indicate definite areas of ambivalence.[44] In his chapter in Willrich and Rhinelander, Marshall Shulman endorses the achievements of SALT I, but he also offers a balanced and sophisticated appraisal of those Soviet-American asymmetries—conceptual, decisional, political and economic—that could frustrate aspirations for a more civilized Soviet-American relationship.[45] Shulman concludes his chapter with the following judgment: "Here perhaps is the real significance of SALT I, for its most important accomplishment is to be found less in the substantive agreements reached than in the educational effect of the negotiating process."[46]

Shulman has implied on previous pages that Soviet leaders have *yet* to attain the level of strategic conceptual sophistication common to American arms controllers, but he also implies that there could well be some merit in the Soviet way of thinking about strategy and arms control. Shulman's argument contrasts sharply with the intellectual hubris to be found in Newhouse. Consider the following example of John Newhouse's thought:

> . . . defending people is the most troublesome of all strategic options, for stability demands each of the two societies stand wholly exposed to the destructive power of the other. Acceptance of this severe and novel doctrine illustrates the growing sophistication of Soviet thinking and some willingness to break with fixed attitudes, including the old Russian habit of equating security with territorial defense. And it points up the American interest in raising the Russian learning curve—in creating a dialogue that will encourage, however gradually, a convergence of American and Russian thinking about stable deterrence. Thinking about deterrence is mind bending even for initiates. It takes time and some knowledge of the weapons as well as the issues.
>
> The gap in such thinking is not just between the U.S. strategic community and the Russians, whose concern with these concepts is more recent. It is also between the Americans and their European allies, and between those Americans directly involved ["inhouse"] and those observing from the sidelines of academia.[47]

This is an example of intellectual arrogance that is usefully revealing of an attitude of mind that has limited the effectiveness of the strategic and arms control policies of the United States over the past decade. With this presumption of American conceptual superiority, a whole series of errors in prediction and possibly in policy action is more easily under-

[43] Apart from the operation of friendship networks, arms control interests now have extra-government institutional form in the Arms Control Association (ACA), while the Federation of American Scientists (FAS) has long conducted itself as an arms control lobby (for example, providing witnesses and prepared testimony for congressional hearings). *Arms Control Today* (monthly publication), published by ACA, was created to be both the "house journal" of the arms control community, and an effective instrument for the dissemination of the views of that community to interested outsiders.

[44] Most useful are the lists of identified gaps in current knowledge provided in Kintner and Pfaltzgraff, pp. 103, 381–382.

[45] "SALT and the Soviet Union," pp. 101–121.

[46] *Ibid.*, p. 121.

[47] Newhouse, *Cold Dawn*, pp. 3–4. This is very close to an assertion that "I (Newhouse has since moved "in-house," to the Arms Control and Disarmament Agency) and my official friends know best, are the most expert—*by definition*."

stood. It is now fully revealed that the United States' intelligence community fairly consistently underestimated the rate of growth of Soviet ICBM and SLBM forces after 1965.[48]

The more defense-minded of the contributors to the books edited by Kaplan and by Kintner and Pfaltzgraff argue that the Soviet approach to the political utility of strategic forces, to the opportunities available in an arms control forum, and to the military functions of strategic forces are very dissimilar from dominant conceptions in the United States. Moreover, it is argued that a convergence of Soviet thought and practice with American thought and practice should not be expected. Indeed, Johan Holst suggests that it is far from obvious that doctrinal convergence would be conducive to a safer world.[49] This does not mean that serious business cannot be conducted in the SALT forum, nor need it mean that the dominant American approach to American strategic postural questions is invalid. What it does mean is that Soviet behavior must not be translated, by conceptual reflex, in terms of models drawn from and reflecting American behavior.

Although Shulman and others sensibly point to the "educational effect of the negotiating process itself," it is now apparent that SALT were better not viewed as a Soviet-American arms control seminar using American textbooks. SALT has undoubtedly raised the level of information concerning strategic issues at the most senior levels in both Moscow and Washington. In a sense, SALT has probably "politicized" particular strategic programs in that there has been higher level interdiction of the standard operating procedures of lower levels of bureaucracy. As of 1976, preliminary conclusions may be drawn with some confidence concerning the "educational effect" of SALT. Despite some of Dr. Kissinger's claims, there is no evidence that the American defense community has "cracked the code" of Soviet thinking about the structure and purposes of their strategic weapons posture.[50] Our comprehension of Soviet strategic thinking should have improved over the past six and a half years, if only because we have had that much extra time to observe and interpret the expansion and qualitative improvement of the Soviet strategic posture. It would seem, if the excellent chapters by Thomas Wolfe and William R. Van Cleave (in Kintner and Pfaltzgraff), by Johan Holst (in Kaplan), and by Marshall Shulman (among others) are to be believed, that Soviet strategic thinking provides no conceptual self-limiting features at all analogous to the American notion of a sufficiency of force for assured destruction.[51] Furthermore, Soviet leaders have offered no evidence that they believe it to be an important function of SALT to enhance American conceptions of strategic stability; and we still do not understand the role of strategic doctrine in the development of Soviet strategic posture. Indeed, as Johan Holst has suggested, it may be "the Soviet way" to develop the weapons first and to select the appropriate doctrine afterwards.[52]

Backward Russians?

Very many American arms controllers have seen in SALT a unique opportunity for the education of misguided or backward Russians. To those analysts skeptical about the arms control wisdom of the late 1960s, the SALT experience has yielded strong evidence supportive of their initial premises and prejudices. It is quite clear from the Soviet literature on America and on arms control that Soviet strategists are not ignorant of the fine flourishes of Western strategic thought. The unwillingness of the Soviet Union to accept American strategic conceptual tutelage would seem to stem from the uncongenial nature of Western thought; from a satisfaction with domestic strategic thought; and from a proper recognition of Soviet national interest.[53]

As many observers of American arms con-

[49] "Comparative U.S. and Soviet Deployments, Doctrines, and Arms Limitation," in Kaplan, *SALT: Problems and Prospects*, particularly pp. 56–57.

[50] For example, see the optimistic prognoses given in Henry Kissinger's Press Conference in Moscow on May 26, 1972, in Senate Committee on Armed Services, *Military Implications of the Treaty on the Limitations of Anti-Ballistic Missile Systems and the Interim Agreement on Limitation of Strategic Offensive Arms, Hearing*, 92nd Cong., 2nd Sess. (1972), p. 99.

[51] In the words of George Rathjens, ". . . there is not the slightest evidence that it [the Soviet Union] accepts the concept of strategic sufficiency." In "Future Limitations of Strategic Arms," in Willrich and Rhinelander, p. 230.

[52] In "Comparative U.S. and Soviet Deployments, Doctrines, and Arms Limitation," in Kaplan, pp. 66–67. A clear statement to the effect that students of the Soviet Union do not understand the role of Soviet strategic doctrine vis-à-vis procurement decisions is David Holloway, "Strategic Concepts and Soviet Policy," *Survival*, 13 (November, 1971), 364–369.

[53] On the strong and very particular roots of Soviet strategic doctrine, see William T. Lee, "The 'Politico-Military-Industrial Complex' of the U.S.S.R.," *Journal of International Affairs*, 26 (1972), 79–83, 86;

trol diplomacy have noted, "the American way" both in *strategic* analysis and in arms control theorizing and practice has tended to be technical rather than political.[54] Unfortunately, the dominant Soviet—and, indeed, the NATO-European—approach to strategy and to arms control has been political. The technical arms control approach to SALT has been dominated by a laudable concern to ensure the maintenance of a condition of strategic stability, commonly defined as a context wherein the "first strike bonus" is close to zero. In other words, the smaller the difference in military effectiveness between a first strike and a second strike, the greater the measure of stability. If we subscribe to the adage that "by their deeds shall ye know them," it is apparent that Soviet leaders have elected to remain indifferent to American lectures on the subject of strategic stability. Despite a decade of American educational effort, Soviet leaders persist obdurately, by their weapon program deeds, in asserting that they are the best judges of their own security interests. They may be misguided, but it is well to take them seriously. The political sensitivity to the possible foreign policy consequences of visible strategic imbalances was a feature of Dr. Schlesinger's stewardship at the Department of Defense.[55] The Vladivostok accord provided, and almost certainly a SALT II treaty would provide, for parity on strategic offensive force levels. Unfortunately, two issues that appeared to be of only minor importance in Vladivostok, the American long-range cruise missile (LRCM) programs and the Soviet *Backfire B* bombers, have since assumed pre-eminent roles as blocks to the completion of a SALT II treaty. These weapons systems are neither clearly *strategic* nor clearly *tactical* in character. Therefore, even if all the LRCMs and *Backfires* eventually to be deployed could be identified by satellite reconnaissance, there could be little confidence that their military missions would be unambiguous.[56]

Many American arms controllers are still resisting the notion that each super-power is playing its SALT games in accordance with very different rules. Intimations that this might be the case may very occasionally be discerned in Newhouse and in Willrich and Rhinelander, but such unpleasant thoughts are not permitted seriously to muddy the text. Among the major edited works discussed here, this theme is developed only in the more defense-minded arguments deployed in Kaplan, in Kintner and Pfaltzgraff, and somewhat unevenly before the congressional committees that considered the SALT I package. It is unfortunate that a subject as important as the Soviet approach to SALT should become an issue in the domestic strategy/arms control debate in the United States. The available evidence indicates that the Soviet Union approaches all negotiations in a tough, competitive spirit.[57] If a Western government wishes to avoid "losing" a round of negotiations, it needs a strong bargaining position and a tough-minded attitude.

Despite the unprecedented dangers that attend a *nuclear* arms race, there is every reason to believe that Soviet leaders are convinced that military competition yields political gains.[58] One may not approve, but it is difficult to see how any other interpretation can be placed upon the evidence available concerning the course of SALT. Skeptical readers are advised to consider the details of the Soviet negotiating posture for SALT II, and the erosion of the posture of the United States—with the dénouement in Vladivostok.[59] SALT II

Wolfe, "Soviet Interests in SALT," in Kintner and Pfaltzgraff, pp. 21–54; Lawrence T. Caldwell, *Soviet Attitudes to SALT*, Adelphi Paper 75 (London: The Institute for Strategic Studies, February 1971); and Uri Ra'anan, "Soviet Decision-Making and the Strategic Balance: Some Reflections," in Pfaltzgraff, *Contrasting Approaches to Strategic Arms Control*, pp. 113–122.

[58] See Senate Committee on Government Operations, Subcommittee on National Security and International Operations, *The Changing American-Soviet Strategic Balance: Some Political Implications*, Memorandum by Uri Ra'anan, 92nd Cong., 2nd Sess. (1972).

[59] The Vladivostok accords comprise a very poor set of agreements in *the longer run*, for the Soviet Union. I base this judgment on the fact that the principal future questions of strategic stability are not addressed in the accords. Those questions pertain to the vulnerability of missile silos, "counterforce matching" and

will not "cap the arms race" in the sense of depriving a dynamic strategic posture of political meaning. Even before SALT I placed a ceiling upon ICBM and SLBM deployments, the Soviet Union was switching from a quantitative to a qualitative arms racing path. Soviet leaders believe in negotiating from strength, in exploiting military strength for political gain (and certainly for gain in terms of the fine print of arms control regimes), and in purchasing a strategic posture that might have some military and political value should war ever occur. These beliefs run contrary to the way in which many Western analysts believe that strategic power ought to be approached in the nuclear age, and they certainly run counter to many of the more optimistic, early prognoses for SALT. The evidence of Soviet adherence to these beliefs, however, is proof neither of Soviet aggressive designs nor of Soviet backwardness. Soviet analysts and politicians, save for the consumption of gullible Westerners, have never endorsed the notion that SALT was an institution in which technical experts would seek to control a nuclear arms race that was evading political control.

The books by Newhouse, Kaplan, Kintner and Pfaltzgraff, and Willrich and Rhinelander necessarily eschew fundamental enquiry, given their topical mandates. These works, however, do not rest upon a well-ordered body of social scientific knowledge concerning arms race dynamics—either generic in scope or particular to the *nuclear* arms race. Authors differ about whether the United States should be more or should be less active in the arms race, but these opinions seem to stem more from fashions among their intellectual reference groups than they do from any deep understanding of which moves, in what circumstances, are likely to produce particular results.

The Schlesinger Shift

The reviving strategic debate of 1973–1976 has seen a struggle by analysts to emphasize the complexity of their subject matter. Such analysts as Fred Iklé, Albert Wohlstetter, Bruce Russett, and Graham Allison have been arguing that the more popular theorems that purport to explain how the nuclear arms race works and what the appropriate criteria should be for a sufficient nuclear deterrent are not good enough.[60] A large part of the present strategic debate is concerned with the appraisal of ideas and programs that their authors hope will remove the less satisfactory features of mutual assured destruction doctrine from the strategic policy of the United States.[61] Former Defense Secretary Schlesinger and his strategic advisers were not seeking simply to justify the latest products of the weapons laboratories, nor did they have as a dominant concern a determination to maximize American bargaining strength at SALT.[62] In his *Defense Report* for FY 1975, Schlesinger repudiated MAD doctrine, he affirmed the proposition that militarily marginal strategic forces might have political value, and—implicitly—he denied that the arms race was necessarily an exercise in futility.[63] The *Defense Report* for FY 1976 was even more explicit in its attempt at redefining the requirements of deterrence in an age of rough parity and mutual vulnerability.[64]

The present debate may center on the wisdom of pursuing a very substantial hard-target counterforce capability or the political salience of static criteria of strategic strength. But very close to the surface of debate are the still underanalyzed policy scientific questions pertaining to arms race dynamics, negotiating dynamics, and the appropriate criteria by which one should be able to design a *good* strategic posture.

Many adherents to a MAD-orientation are prepared to grant the limited validity of the criticisms that recently have been leveled at MAD doctrine. They are concerned, however,

to political perceptions of specific imbalances. See Colin S. Gray, "SALT II and the Strategic Balance," *British Journal of International Studies*, 1 (1975), 183–208.

Iklé, "Can Nuclear Deterrence Last Out the Century?" *Foreign Affairs*, 51 (January, 1973), 267–285; Wohlstetter, *Legends of the Strategic Arms Race;* Wohlstetter, "Threats and Promises of Peace: Europe and America in the New Era"; Bruce Russett, "Counter-Combatant Deterrence: A Proposal," *Survival*, 16 (May/June, 1974), 135–140; and Graham Allison, "Questions About the Arms Race: Who's Racing Whom?: A Bureaucratic Perspective," in Pfaltzgraff, *Contrasting Approaches to Strategic Arms Control*, 31–72.

[61] A good way into the debate is via *Orbis*, III (Fall, 1974), which contains eight articles on "the Military Balance, U.S. Strategic Forces, and the New Targeting Doctrine."

[62] Laurence Martin, "Changes in American Strategic Doctrine—An Initial Interpretation," *Survival*, 16 (July/August, 1974), p. 160.

[63] Schlesinger, *Annual Defense Department Report, FY 1975*, respectively pp. 32–41 (MAD doctrine), 27, 43–44 (political consequences of perceived strategic imbalance). Schlesinger argued that unless the United States gives evidence of a willingness to accept the current Soviet arms race challenge, the Soviet Union will be allowed a politically advantageous measure of strategic imbalance.

[64] Schlesinger, *Annual Defense Department Report, FY 1976 and FY 197T*, pp. II-1–9.

lest the pursuit of the best strategic doctrine fatally impair the efficacy of the working strategic doctrine that has, for nearly a decade, been the principal conceptual guide for United States strategic posture.[65] Furthermore, although it may be true that MAD doctrine is morally repugnant to civilized men, would be militarily irrelevant to any context, and is a prescription for a paralysis of political will, many strategists remain to be convinced that the proposed alternatives offer any significant improvement.

One of the more interesting statements in the books under review appears in Richard Garwin's contribution to Kaplan. Garwin writes:

> It is in the interest of both sides to have a stable but responsive strategic posture, but our knowledge of the structure and behavior of military-political-sociological systems is by no means adequate to support detailed analyses. Our posture must be simple if we want to be sure that it is really understood by the other side.[66]

Garwin might have argued that the United States should adopt a posture sufficiently simple to be understood by those Americans who are not strategic analysts—the President and (the present incumbents excepted) the Secretaries of State and Defense, for example. Unfortunately, the strategic postures that most obviously meet the criterion of simplicity are also, one could say necessarily, unlikely to be credible. MAD doctrine, understood to imply relatively massive attacks upon urban areas, is simple, but a diminishing number of Americans have any confidence that a MAD-orientated SIOP should be invoked in any resort save the last.[67] If strategic forces are to retain any political meaning, a president must ensure that his strategic posture allows for flexible employment. Clearly, the fewer options that one has, the less complex the calculations of the adversary should be. But the adversary will always confront the task of predicting political will. There should be some relationship between political will and strategic posture, but no amount of calculation can remove the residual unknowables.

Richard Garwin was correct to point to the limitations in American comprehension of the institutions and the processes that produce strategic policy decisions in the Soviet Union. However, Garwin does happen to be one of the firmest adherents to the arms control school which has imputed *American* concepts to the Soviet Union and has endorsed a mechanistic model of action-reaction as being crucial to the arms race. This model necessarily assumes that the super-powers act and react as collective strategic logicians. For example, Garwin writes that "the elimination of ABM would break a positive feedback loop leading to the arms race."[68] In simple action-reaction logic, Garwin is correct. But the history of Soviet and American MIRV programs after May 1972 demonstrates that the forces that drive major arms programs are more complex than many arms controllers had previously believed. Major weapons procurement is a field of redundant causation. Arms-race histories may be written that emphasize the momentum of technological innovation, or the games played by bureaucrats, or the threats perceived and misperceived abroad—all of which have partial validity.[69]

The congressional hearings held in the summer of 1972 to review the content and implications of the SALT I Treaty and Interim Agreement revealed that conceptual education was understood by the Soviet delegates to be beyond their mandate. The hearings offer a wealth of technical detail and reflect the imbalance of strategic theoretical opinion within the extra-official defense/arms-control community.[70] There were very few thorough-going critics of the ideas upon which the SALT I agreements were founded. A major potential value of the hearings, however, lay not in their role as a forum for the rehearsal of established attitudes and opinions, but rather in the possibility that officials—and particularly delegates—would hold forth about the insight gleaned into the working of Soviet strategic minds.

[65] The rise of assured destruction in official favor may be traced through Mr. McNamara's *Posture Statements* from 1964 until 1968. See Table I in Graham T. Allison and Frederic A. Morris, "Armaments and Arms Control: Exploring the Determinants of Military Weapons," *Daedalus*, 104 (1975), 110–111. Revealing in (I suspect) an unintentional way is Ralph Sanders, *The Politics of Defense Analysis*. (New York: Dunellen, 1973), p. 142. Also see Newhouse, *Cold Dawn*, pp. 66–68.

[66] "Superpower Postures in SALT: An American View," p. 98.

[67] *Annual Defense Department Report, FY 1976 and FY 197T*, pp. II-1–2.

[68] In "Superpower Postures in SALT: An American View," p. 113.

[69] See Ted Greenwood, *Making the MIRV: A Study of Defense Decision Making* (Cambridge, Mass.: Ballinger, 1975).

[70] The principal SALT-related hearings were the following: Senate Committee on Armed Services, *Military Implications of the Treaty on the Limitation of Anti-Ballistic Missile Systems and the Interim Agreement on Limitation of Strategic Offensive Arms;* Senate Committee on Foreign Relations, *Strategic Arms Limitation Agreements;* Hearings, 92nd Cong., 2nd Sess. (1972).

Newhouse has written that "in the formal meetings as well as during informal dinners and lunches, each side discovered a great deal about the other's attitudes."[71] If the United States delegation did learn a great deal about Soviet attitudes in the strategic field, then—judging from the evidence offered in *Cold Dawn* and in the four sets of congressional hearings—it must have been one of the best-kept secrets of modern times. Before the Senate Committee on Armed Services, the Chief Delegate to SALT, Gerard Smith, stated: "I think that the Soviets, as a result of the SALT negotiations, have moved toward accepting the concept of assured destruction. I would say that I don't know. I have no way of judging whether their doctrine, their national doctrine, says that this is their national strategic concept. I just don't know."[72]

As Hedley Bull has observed about the Washington and London Naval Arms Limitation regimes of the interwar years, common rationales need not be shared among the participants in an arms control regime.[73] However, given the scope for the qualitative improvement of weapons allowed to the Soviet Union in (and duly exercised during) the Interim Agreement of SALT I and in the Vladivostok accord for SALT II, more than idle academic interest is engaged in attempts to answer the questions of how the Soviet leaders conceive of the utility of strategic forces, and what they understand SALT to be about.

Facing Facts

If the Soviet Union is using SALT as a framework to support a détente that will gradually be redefined as the strategic balance moves more and more in the Soviet direction,[74] then a number of reasonable American responses are defensible. First, while eschewing short-term panic measures, one may endorse former Secretary of Defense Schlesinger's pursuit of an "essential equivalence." In practice this entails a substantial revision in strategic thought. In the Schlesinger version of responding to the perceived Soviet challenge, one must seek a great measure of symmetry — even in particular weapon categories. Also, one must seek a rough balance of counterforce capability and endeavor to maintain a strategic posture of such proportions that no unsophisticated politician is likely to be so impressed by a contemplation of the "static measures" of strategic (im)balance that he believes that the United States will lack the political will to act. Second, suppose one grants that SALT thus far has produced only poor bargains for the United States; still one might elect to remain relatively unmoved. The critics of counterforce doctrine are saying that MAD doctrine is sound (as good a doctrine as technology permits) and should not be abandoned simply because backward Russians still refuse to face contemporary military-technological facts.

Strategists are becoming aware of the time-specific and ethnocentric roots of their strategic wisdom. Not merely are central tenets of our deterrence theories the products largely of American scholarship, they also tend to be predicated upon a dyadic interstate context. An urban area ABM defense system may be heretical in terms of a dyad of strategic actors that are striving to contain their strategic competition by the acceptance of MAD concepts, but such an ABM system should be viewed in a far more favorable light were the superpowers to move into a nuclear proliferated world. The contributors to a recent book edited by Richard Rosecrance[75] have contemplated the deterrence problems of a world that might contain not six nuclear powers, but 16 or 26 or 36. These authors have sought to alert strategic analysts to the possible long-run consequences of MAD doctrine. Undeterrable leaders, nuclear accidents and miscalculation may be unlikely for one year, or for five—with the present five nuclear weapon powers (six, if India is included)—but how unlikely are these events over 25 or 50 years, with an unpredictable number of nuclear powers? Better ABM systems may not be the answer, but unless one chooses to put one's faith in chiliastic fantasies,[76] it is none too soon for strategists to begin contemplating how one should think about such an unfamiliar world.

The world of an archetypal American arms controller has been, and remains, a comparatively simple one—dominated by clear dichoto-

[71] Newhouse, *Cold Dawn*, p. 173. A very different view is Van Cleave, "Political and Negotiating Asymmetries: Insult in SALT I," pp. 16–19.

[74] Probably the most trenchant critique of SALT I along these lines is Donald Brennan, "When the SALT Hit the Fan," *National Review*, June 23, 1972; more recent analysis in a similar vein is Nitze, "Assuring Strategic Stability in an Era of Détente."

[75] *The Future of the International Strategic System.*

[76] For one example of such fantasies, see Clemens' aspiration that arms control may move the superpowers from detente to entente. *The Superpowers and Arms Control*, p. 134.

nies. Weapon systems tend to be *either* stabilizing or destabilizing in their effects. Weapon systems are either first-strike in orientation—which is *bad*—or are second-strike in orientation—which is *good*. On its own terms, this form of analysis is logically impeccable. Unfortunately, Soviet leaders have proved to be unsympathetic to it.[77] With differing conceptual frameworks, the potential for misperception of strategic and political intentions was and remains profound. Furthermore, one learns from much of the American arms control community's comments upon SALT, that one is *either* serious about seeking to control the arms race, *or* one is not. In the former case one should subordinate opportunities for unilateral advantage in the interest of reaching reasonably balanced accords. Also, one should adopt the attitude that the nuclear arms race is a threat to all of humanity, and not a vehicle for national political gain.[78] Soviet leaders do not inhabit this Aristotelian world of either/or choices.

In the mid-1960s, it was expected that the Soviet Union would be content with a secure second-strike capability. According to American assured-destruction doctrine, this was all that the Soviet Union needed. Later in the 1960s, the Soviet Union was expected to be content with a parity in the "static measures" of strategic balance. As of 1976, the momentum of qualitative advance can only be explained plausibly as a bid for whatever political gain a favorable strategic imbalance will yield. In arms control terms, the Soviet Union may certainly be faulted for declining to explain the rationales behind her strategic programs, but the crucial and avoidable Western error was the enduring misconception that Soviet motivation could be explained in terms of American arms control theory.

In SALT I, as prospectively in SALT II, the Soviet Union laid the basis for a major hard-target counterforce capability vis-à-vis the United States which the United States would have great difficulty in matching. The Soviet Union was accorded the right to deploy 313 "heavy missiles" compared with none for the United States. Furthermore, the Interim Agreement failed to set any limits of importance upon the expansion of the volume of ballistic missiles and provided no lasting compensation for the greater throw-weight of Soviet missiles. In signing the ABM Treaty, the United States succeeded in trading an advanced American technology for an obsolescent Soviet technology, looking to a future in which Soviet missile throw-weight married to accurate MIRV's would put the United States in far more urgent need of a dedicated silo-defending ABM system than the Soviet Union.

Until the Vladivostok meeting, Soviet leaders asserted that the quantitative, asymmetrical limits upon the ICBM and SLBM inventories were completed business. The Soviet "concessions" at Vladivostok on equal aggregates for offensive delivery vehicles and MIRV launchers did not mark any change in the Soviet approach — appearances notwithstanding. Progress in SALT II negotiations was not registered prior to October-November 1974, partly because the United States was insisting upon an arms control regime that would discipline sharply the future hard-target counterforce capabilities of the Soviet Union.

The United States sought to secure an agreed level of MIRV launchers (in the region of 600–750) for the Soviet Union such that upgraded *Minuteman* silos (designed to resist blast overpressures up to 1,000 pounds per square inch) would be viable for more years into the 1980s than seemed likely without such an agreement. Because of the very large Soviet advantage in missile throw-weight over the United States, Dr. Kissinger sought a favorable asymmetrical limit on MIRV launchers. When this kind of proposal predictably failed to excite Soviet enthusiasm, the United States then proposed a common, relatively low limit for aggregate missile throw-weight. Such a scheme would, of course, have denied the Soviet Union any advantage from her large missile boosters and would place at a premium the American technical leads in missile accuracy and warhead design. The Soviet dismissal of these suggested bases for SALT II induced the United States to move from "fairly complex proposals to substantially more simple ones, and this permitted both sides finally to come to an agreement."[79]

[77] A former member of the SALT I delegation, Joseph Kruzel, has asserted that the ABM Treaty "had the dual effect of shutting off a new avenue of strategic arms competition and legitimizing the doctrine of assured destruction" in "SALT II: The Search for a Follow-On Agreement," *Orbis*, 17 (Summer 1973), p. 361. Unfortunately, it may be argued that the Soviet Union was very interested in constraining an ABM competition because of the anticipated superiority of United States' defensive technologies.

[78] In the words of a SIPRI author: "The strategic arms race should be recognized as a malignancy and dealt with cooperatively by those responsible for it." *SIPRI Yearbook, 1973* (New York: Humanities Press, 1973), p. xix.

[79] Dr. Henry Kissinger, Press Briefing in Vladivostok, November 24, 1974, official text (mimeo), p. 7.

Alas, the "breakthrough" at Vladivostok that, in Dr. Kissinger's euphoric words, enabled the superpowers to achieve "a cap on the arms race,"[80] was purchased at the price of future strategic instability. The very high common aggregates of Vladivostok mean that both sides are free to pursue the qualitative arms race as energetically as they choose;[81] that the missile silos of each superpower will be acutely vulnerable to a disarming attack in the 1980s; and that the Soviet Union, with her enormous advantage in missile throw-weight, will be able to dispense many more silo-killing MIRV's than will the United States. Whether or not these prospective facts should promote serious concern is a subject of current debate.

In a remarkable pioneering book, Matthew Gallagher and Karl Spielmann have sought to outline the ways in which American interpretations of Soviet behavior are probably in error.[82] Without seeking to present a portrait of an idiosyncratic Soviet Union impenetrable to Western analysts, the authors demonstrate the inapplicability of the simple logical models ("Shortcuts to Confusion" — the title of Chapter 1) that American arms controllers have wielded as the principal tools for the "cracking open" of the arms race system. The authors do not argue that American strategic concepts and notions of bureaucratic politics are necessarily invalid, for the United States; they argue that these notions should not be projected uncritically upon the Soviet Union. Only by accepting the divergence of Soviet practice in doctrine and procurement from the American model can the United States both compete effectively in the arms race and fashion a defense policy and a negotiating posture that is likely to induce cooperation from a very un-American adversary.

Conclusion

For the first time in a decade, the standard tenets of deterrence theory and of arms control doctrine are subject to widespread systemic criticism (the ABM debate of 1969 was, by and large, more limited in scope). Despite the prominence of such implicitly value-lader terms as "stability" and "parity" in the arms control literature, the notion of mutual assured destruction was conceived and rigidified in an era of quiet American confidence that a perpetual margin of superiority could be maintained. As of 1976, strategic theorists are beginning to realize that the past decade and a half has seen no substantial measures of arms control; that MAD doctrine reflected contemporary military-technological necessity and represented a very limited aspect of a deterrent relationship rather than a total and finite solution to nuclear strategic problems; that the Soviet Union is not usefully to be modeled by social scientific arms controllers in an American image; and that the rough and tumble of international politics cannot be avoided in the forum of protracted arms control negotiations.

American negotiating performance in SALT offers much negative instruction as to *How Nations Negotiate*.[83] Analysts seem to be so paralyzed by the conceptual difficulties attendant upon the use of such terms as "power" and "bargaining power" that serious study of the most important questions pertaining to negotiation is rare indeed.[84] Strategic analysts are coming to stress the urgent need to study Soviet policy on its own terms — and to seek to improve the level of our comprehension of how the Soviet political system processes strategic policy decisions.[85] A closer attention to Soviet behavior, a greater willingness to admit that there are regions of inquiry in which we are ignorant, and a diminished tendency to project our ideas upon others — all these should encourage strategic analysis that is less culture-bound, richer, and more relevant to a superpower strategic balance that is evolving in favor of the Soviet Union. The margin for tolerable error is diminishing.

BOOK REVIEWS

Russell and Moore: The Analytical Heritage. By A. J. Ayer. (Cambridge, Mass.: Harvard University Press, 1971. Pp. 254. $8.75.)

Here is the record of Professor Ayer's William James lectures, delivered at Harvard University in 1970. It is a book largely given over to a tactful exposition of Russell and Moore; but there is nothing on Russell's purely logical work and, except for a brief section in which Ayer describes an interesting connection between the paradox of analysis and the naturalistic fallacy, nothing on Moore's ethical writings either. In his Preface Ayer writes that his original intention had been to issue this volume as part of his study of Charles Sanders Peirce and William James: the earlier work has been published under the title *The Origins of Pragmatism,* so the quartet is now complete.

Twentieth-century philosophy is segmented, rather like an arthropod. In major intervals there is the revolt against idealism, logical atomism, logical positivism, which has acquired something like a retrospective moral grandeur among social scientists, linguistic analysis and ordinary language philosophy, logical analysis and the exaltation of quantification theory—this in the sense of W. V. O. Quine—and more recently, under the influence of work originally begun in modal logic, a partial revival of speculative metaphysics. Despite Ayer's inventive judgment that ". . . those who look upon him as an exponent of ordinary-language philosophy . . . are doing him an injustice" (p. 245), G. E. Moore is fixed firmly as an enthusiast for the limpid vernacular. For linguistic analysis generally Russell had dry contempt. But his own work of the 1930s and 1940s sometimes seems thin. It is the startling and original volumes of his early and middle years that for all their unquestioned carelessness have entered completely into the great canon of English philosophy. So Russell seen as an historical figure looms bulkily over the first third or so of this century's analytic history.

Ayer's discussion is not historical, and readers interested in thematic development might prefer John Passmore's *One Hundred Years of Philosophy* (London: Gerald Duckworth & Co., Ltd., 1957) or J. O. Urmson's *Philosophical Analysis* (London: Oxford University Press, 1956). The method works well in the long stretch of the book given over to Russell. Here are many of the famous doctrines: the theory of logical constructions; the theory of descriptions; logical atomism, broken by Ayer into two parts; neutral monism. The analysis is often adroit, especially in the section devoted to the theory of descriptions: Ayer neatly balances Russell's view against Strawson's. But there are certain matters of emphasis that seem unusual. Ayer urges that almost all of Russell's philosophy is driven "by his conception of what there is, or rather, of what there can rationally be thought to be" (p. 10), adding in frank perplexity that "the central part which this ontological question plays in Russell's treatment of philosophy has not . . . been at all widely recognized." But Russell's overriding concern has been with epistemology: ontology is a subject dominated by men with austere passions looking to record their conviction that the world is really the arena for a handful merely of the elementary particles, or the atomic facts, or that dynamically curved and empty space which, according to geometrodynamics, makes up the ultimate stuff of creation.

Ayer's discussion of Moore is less successful. Like Henry James, Moore wrote in a style at once persuasive and rebarbative. Ayer goes at it manfully in chapters that treat of Moore's refutation of idealism, the defense of common sense, abstract entities and Moore's concept of analysis. But Moore *is* a vastly more restricted philosopher than Russell, and it is difficult to maintain unflagging interest in a man who consumed himself with such questions as whether sense data have unexamined parts. Ayer concludes his discussion by drawing an interesting distinction between Moore's concept of analysis and Russell's: while Russell envisaged a *revision* of ordinary language as a result of analysis, Moore looked only to a more elaborate *description* of ordinary language. Curiously, Moore's commitment to description merely seems to have been offered in a largely ceremonial spirit, or so Ayer claims, since Moore's technical remarks on the theory of perception waddled over the bounds of ordinary language and the rules of usage that it suggests.

DAVID BERLINSKI

University of Puget Sound

Frantz Fanon. By David Caute. (New York: The Viking Press, 1970. Pp. 116. $4.95, cloth; $1.65, paper.)

Fanon. By Peter Geismar. (New York: Dial Press, 1971. Pp. 214. $6.95, cloth; $1.95, paper.)

Five years ago, on the dust jacket of his book, the publisher could announce without excessive advertising license that since Fanon's death in 1961, ". . . *The Wretched of the Earth* has become a key ideological document for radical movements across the globe, notably black militants in the United States." Today the book has its currency mainly in the reading lists of courses on revolution in academe. The militancy of the black movement in the United States has been suspended, and the blacks in Africa have found oppressors of their own race as their new rulers. Yet Fanon's work lives to remind us of the intensity of anti-white passion appeased neither by the achievement of political sovereignty in the former colonial areas nor by feeble attempts at amelioration of the black condition here at home.

The two biographies under review, sympathetic but not uncritical, differ in approach and quality. (A more recent biography, *Frantz Fanon, A Critical Study,* by Irene L. Gendzier [New York: Vintage, 1974]), provides a more comprehensive analysis of Fanon's politicization and evaluation of his influence on the Algerian revolution and elsewhere.) Caute's account is by far the more analytical and systematic presentation of Fanon's ideas. Geismar's, drawn largely from interviews and conversations with those who had known Fanon, is the more "personal," though it surprisingly lacks detail about individual and family influences on his early development. The portrait of Fanon that emerges from his admiring biographer is one of an intense and passionate—and often impatient, scornful and overbearing—man, who packed careers as a soldier, psychiatrist, writer, revolutionary and diplomat into the brief span of 36 years (1925–1961). He spent the last few months of his life ironically under treatment for leukemia in Bethesda Hospital, outside Washington, D.C., capital of the country he loathed, regularly visited by a member of the American diplomatic service who probably was a C.I.A. agent.

The sequence and themes of Fanon's writings are so interwoven with his own personality and personal development that psychological speculation is difficult to resist. In his review of the Geismar and Caute biographies (*New York Times Book Review,* March 14, 1975, p. 5), Albert Memmi, who, like Fanon, has had something original to say about the relations between colonizers and the colonized, suggests that Fanon ". . . sought the solution to his personal drama in political action and philosophy." Born in Martinique, Fanon thought himself French and white only to find in France that he was regarded as French West Indian and black. Nor did problems of color and solidarity among the oppressed resolve themselves in Algeria or Africa. He could neither assimilate with his oppressors nor could he return to his people and his past. Caught in this unresolvable tension, if I understand Memmi, Fanon was driven to propose a new man in a totally reconstructed world.

Whatever the merit of such psychological interpretation, Fanon's reputation and influence seem to rest now on *The Wretched of the Earth* (trans. Constance Farrington, [New York: Grove Press, 1966]), written in the last year of his life. The work hardly qualifies as a carefully constructed treatise in revolutionary theory. It is, as Caute notes, imprecise, lacking in clarity, bristling with generalizations usually unsupported by evidence, and often subsuming the activist and the ideal in a single categorical affirmation. Yet it is in Caute's opinion "one of the great political documents of our time" (p. 74). Geismar would take the edge off the criticisms leveled against *The Wretched* by characterizing it as an *"outil de combat,"* part of the war against colonialism, "the contribution of a skilled revolutionary propagandist" (pp. 200–201). True enough, but Fanon had intended it as a revolutionary theory for the Third World, and so it has been read.

The core of Fanon's theory is that the authentic revolutionary class in the Third World is the poor peasantry who have kept their moral values and their devotion to the nation intact. Based thus in the countryside and sparked by deviant nationalists who have become disaffected with the orientation of the nationalist parties, the revolution moves into the urban areas where the "Lumpenproletariat" —the classless idlers, pimps, prostitutes, and petty criminals—provide the spearhead. Fanon rejects the native proletariat, privileged in African society, as a revolutionary class, nor does he provide any role, as Mao Tse-tung did in his revolutionary strategy, for sections of the native bourgeoisie whom Fanon dismisses as "parasitical." Central to his theory

also is the function of violence as a liberating force. Violence is the ultimate psychological cathartic. Through violence "organized and educated by its leaders," the people will come to understand social truths. Violence is a political necessity in armed struggle *and* a means of social and moral regeneration to reunite the community divided by colonial policy. Psychologically it would serve to eradicate the inferiority complex of the colonized, erasing apathy and despair and laying the groundwork for the creation of a productive citizenry. Decolonization cannot be represented by the mere establishment of nationhood. Rather "decolonization is always a violent phenomenon . . . quite simply the replacing of a certain 'species' of men by another 'species' of men . . . the whole structure being changed from the bottom up" (*The Wretched of the Earth*, p. 29). Fanon calls for no less than a transformation of the consciousness of both the colonized and the colonizer.

Just as Marx has been faulted for expecting too much of the proletariat—a revolutionary consciousness that would provide the driving force for the transformation of society—so Fanon can be criticized for demanding too much of the peasantry and lumpenproletariat. Commentators along the political spectrum have not found it difficult to criticize Fanon's political ideas and the messianism embedded in his theory. (For a conventional Marxist critique, see Jack Woddis's, *New Theories of Revolution* reviewed in *APSR*, 68 [June, 1974], 1751–1752.) Among the *engagé*, however, there remains the conviction that Fanon's ideas are highly relevant to the most pressing problems of contemporary Africa: the improvement of the condition of the peasant masses and the materialization of values specific to the African context without reference either to capitalism or socialism. (E.g., Guy Martin's "Fanon's Relevance to Contemporary African Political Thought," *UFAHAMU*, vol. IV, no. 3 [Winter, 1974], 11–34.) At bottom, Fanon's life and work are testament to the psychological damage inflicted on both the colonizer and the colonized wrought by imperialism and to the inadequacy in human terms of any concept of decolonization that is equated with formal sovereignty.

BERNARD S. MORRIS
Indiana University

Civil Disobedience: Aid or Hindrance to Justice? By William Sloane Coffin, Jr., and Morris I. Leibman. (Washington, D.C.: American Enterprises Institute for Public Policy Research, 1972. Pp. 93. $5.75.)

Private Conscience and Public Law: The American Experience. By Richard J. Regan, S.J. (New York: Fordham University Press, 1972. Pp. 245. $8.00.)

Civil Disobedience and Democracy. By Elliot M. Zashin. (New York: The Free Press, 1972. Pp. 368. $7.95.)

Civil disobedience is generally recognized to be an extraordinary form of illegal action. Both its advocates and opponents recognize that it is different in nature from ordinary lawbreaking, and most agree that the difference consists in the motive, manner, and aim of the disobedience. Unlike ordinary criminals, the civilly disobedient are thought to act out of moral concern, publicly and nonviolently, for the purpose of avoiding evil or doing good. This common understanding gives such extraordinary disobedience a cloak of respectability and tends to cast the public controversy aroused by such disobedience in terms of reconciling the claims of morality with the requirements of public order and stability.

Civil Disobedience: Aid or Hindrance to Justice? may serve as an useful introduction to the issues raised by conscientious disobedience in protest of public law or policy. It records a debate between William Sloane Coffin, Jr. and Morris I. Leibman, and their discussion of the title issue with a panel of distinguished citizens. It is a swift and eloquent debate, not without impassioned exchange or insight, in which reasoned rhetoric blends with platitudinous demagoguery. Dr. Coffin asserts the primacy of individual conscience over all, and defends civil disobedience as a political weapon for the downtrodden in righteous pursuit of their heartfelt desires. Mr. Leibman condemns such lawless action as essentially unreasoning, uncivil and undemocratic—a threat to just order and useless for solving the complex problems of a technological "conglomerate" like the United States. Their remarks concerning the primacy of reason or will in public affairs, of persuasion or force, form the most suggestive and least conventional exchange regarding the relation of law and conscience to justice in civil society.

This relation is not a simple one in which reason or wilfulness is necessarily to be found on one side or the other in a conflict between law and conscience. However, the fact that law is no longer viewed as a rule of reason but

as the embodiment of a particular morality—if not merely the instrument of dominant interests—tends to make conscientious disobedience appear to be an authentic voice of righteousness raised in desperate opposition to established injustice. Richard J. Regan, S.J. rejects this common view of civil disobedience because it divorces legality from morality. He objects to the divorce because public laws in democratic societies express collective moral judgments and, in the United States at least, also recognize freedom of conscience. For this reason, "the issue in conflicts of conscience and law . . . is not simply one of morality versus legality, but, from the viewpoint of morality, one of competing moral judgments and, from the viewpoint of legality, one of conflicting legal claims" (pp. 185–86).

As a political scientist, Father Regan relinquishes to philosophers and theologians the task of assessing the competing moral claims of private conscience and public law. He has chosen instead to formulate generalizations descriptive of the legal status given to conscientious objection in the United States. To accomplish this object, he surveys the relevant Court decisions in an attempt to identify the different public interests at stake in the various conflicts with conscience, and to determine their relative importance. Similarly, he constructs a "typology of moral obligation" in an effort to distinguish the kinds of conscientious imperative and to determine their relative significance. The analysis is apparently intended to produce empirically grounded generalizations predictive of judicial behavior in future determinations of conflicts between law and conscience.

The result is disappointing for its formality. "The most salient conclusion from the cases surveyed is that no claim of conscience, however high, prevailed against a public interest ranked high"—or "even moderately high" (p. 190)—"by a majority of justices" (p. 188). On the other hand, "when Court majorities have rated unambiguously low the public interest at stake against private claims of conscience, the latter, of whatever quality, have been regularly vindicated" (p. 193).

This disappointing formality appears to be a necessary consequence of the formality inherent in Father Regan's method. It is impossible to make intelligible the relation of law and conscience in a political society without examining what each is. Perhaps recognition of this led Father Regan to include an interesting appendix outlining the prominent theories of conscience in the Western tradition, but he makes no attempt to determine which theory correctly describes what conscience is. Instead, he silently adopts one theory in constructing his typology of moral obligation, treats conscience phenomenologically as a matter of personal consciousness of guilt or moral integrity, and classifies the various claims of conscience as high, moderate or low according to the degree of obligation perceived in conscientious commands and prohibitions, or the degree of guilt felt for failure to follow them. Similarly, he makes no attempt to explain the Court's judgment of the high, moderate, or low significance of the public interest at stake in its decisions granting or refusing legal status to the claims of private conscience in matters of national security, public order, public welfare, the family or education.

This methodological modesty makes Father Regan's book valuable mainly for its succinct and comprehensive survey of the relevant Court cases. It also accounts for its almost fatal weakness—its failure to make intelligible the primacy of law which it amply demonstrates. In the conflicts of law and conscience, the public interest has always prevailed except in matters of little moment and, after all, it is the law which—in recognition of a public interest (p. 8)—accords to conscientious objection whatever legal status it happens to enjoy in the United States.

The destruction of this primacy of law in the minds of citizens appears to be a primary object of Elliot M. Zashin's *Civil Disobedience and Democracy*. As a product of the Berkeley milieu in the early 'sixties, Zashin became convinced that American society suffers from established injustices incapable of remedy by ordinary political action. Less theoretical than practical, his aim is to "legitimize civil disobedience as a democratic tactic," to actualize "its potential as an effective political technique" for securing social peace and justice in the United States (p. 1). His book aims overall to create the tolerance of civil disobedience necessary for its effectiveness as an instrument of the social and political change he so ardently desires.

To make civil disobedience respectable, to "legitimize" it, requires that law-abiding citizens be disabused of their conviction that conscientious disobedience in pursuit of political change is uncivil, undemocratic, and wrong. Zashin attempts to disarm them of this conviction through an interpretation of liberal democracy designed to support the view that civil disobedience is an unconventional but loyal form of political participation. His meth-

od is to weave by artful selection from the conflicting views of Hobbes, Locke, Rousseau, Jefferson, Bentham, Mill, T. H. Green, and others, a coherent theory of civil disobedience as a natural extension of the liberal principle of government by consent of the governed. The argument is a prolix presentation of now familiar views of the "New Left."

Liberal democracy seeks to protect the individual as an autonomous moral agent. It intends "to minimize (his) subordination to purposes other than his own" (p. 35), and to avoid subjecting him to "ends and means with which he cannot feel any spontaneous interest in complying" (p. 61). The principle of consent is expressive of these ends. But genuine moral autonomy requires that consent be a fully informed expression of personal consciousness (p. 92), and voting studies have shown that most citizens do not consent in this way (p. 302). Certainly disaffected citizens do not assent to policies from which they dissent (p. 300). Government by consent thus appears to be a chimera rather than a genuine means of avoiding alienation (p. 303). (Indeed, feeling-put-upon may be a necessary consequence of government since all rule, even majority rule, involves ruling—a subordination of the ruled to the decisions of those who rule.) Fidelity to the principle of moral autonomy requires liberal democracy to find an alternative to rebellion and acquiescence for the powerless and the disaffected (p. 94). Politics, of course, is the true middle ground between rebellion and subjection. But for the politically ineffective civil disobedience seems a viable middle way between autonomy and alienation—between getting-one's-way and feeling-put-upon. By this subjectivist transvaluation of the aims of modern republicanism, Zashin can claim that "the intent of democracy is also the intent of civil disobedience" (p. 61).

But this tolerance-breeding charm may be broken either by the impatience of the alienated for what they desire, or by the fears of law-abiding citizens for the safety of the Republic. To assure the efficacy of civil disobedience, Zashin tries to persuade disaffected citizens of its utility and to convince satisfied citizens of its harmlessness. His method is to posit a suitable definition. To qualify as civil disobedience, unlawful political action must profess a higher obedience, intend neither open violence nor secret subversion, and accept punishment which is truly legal (p. 118). To still the fears of decent citizens he thus limits the lawless pursuit of conscientious desire, but the limits are not too stringent lest the alienated be driven to reject civil disobedience as a viable alternative to rebellion or acquiescence (p. 141). Civil disobedience is by definition made useful, harmless and loyal. Its advocates eschew "revolution . . . made in the old way." They wish only "to transform American political and social institutions in a radical way, but without betraying their adherence to democracy, equality and humanism" (p. 329).

It is perhaps pointless to criticize charming advocacy for superficial scholarship, conceptual confusion and fallacious argument. Certainly Zashin's tedious study is valuable for its unintended revelation both of the effects of ideology upon inquiry and of the nature of civil disobedience. Civil disobedience can be distinguished from both conscientious objection and ordinary lawbreaking by its emphatically political character. Arising here from a conscientious and abstract partisanship, it appears to be a timid—if not masked—species of civil war. At every decisive turn, the advocates of civil disobedience justfy this unlawful political action by their conscientious desire for a bloodless revolution in America.

ROBERT F. SASSEEN
San Jose State University

Tradition, Change, and Modernity. By S. N. Eisenstadt (New York: John Wiley & Sons, 1973. Pp. 367. $14.00.)

I know of no sociologist whose books and essays produce in me so great a feeling of utter helplessness as do those of Professor Eisenstadt. In 1957 I published my first review of one of his books (*From Generation to Generation*). That was his first piece of work written under the spell of Professor Parsons, who had spent the previous decade or so writing in such a fashion as to give all of the individuals who were prematurely anti-Parsonian for the wrong reasons a perfectly tenable place to stand. Professor Parsons had gone into his binary stage. He and his disciples took a bunch of concepts—now called "pattern variables"—and treated them as rigidly mutually exclusive rather than as differences of degree. Neither Parsons nor his disciples ever used them as though they were in fact binary. I referred to that then as the fallacy of misplaced dichotomies; in private conversations Professor Eisenstadt agreed that the categories were not dichotomous.

I feel helpless when I confront the work of Professor Eisenstadt because I believe him to have an excellent mind. I am also rather ar-

rogant about my own capacities. I find it extremely frustrating therefore when I cannot make head or tail of what he writes when I try to read it carefully. There are, after all, a group of people who consider themselves to be sociologists who have no truck with scientific analysis as such and are more properly to be judged on their humanistic contributions. Professor Eisenstadt has, as far as I know, no such pretensions to cover his tracks. Let me try to make the sources of my frustration explicit in terms of the text here for review rather than personal and autobiographical.

If the blurb for his book correctly represents his view of it, Professor Eisenstadt thinks the book focuses a collection of his essays on the patterns of change in contemporary and transient societies; explores the role of tradition in such changes; invokes comparisons among European countries, China, Japan, etc. to make his points; criticizes extant theories and suggests new approaches. I have tried to condense this fairly.

Professor Eisenstadt begins his book (pp. 4–5) by stating three qualitative dichotomies: liberty vs. authority, stability and continuity vs. change, and modern social rationalities vs. cultural orientations (presumably modern social rationality is not a cultural orientation). These qualitative dichotomies somehow get combined with ". . . the description and analysis of the structural and organizational aspects of different types of societies" (p. 7). Durkheim's distinction between mechanical and organic division of labor is cited as support for the relevance of such dichotomous tools (p. 8). What Professor Eisenstadt, along with most other sociologists, does not know is that Durkheim saw through this distinction in the very book in which he presented it (*De la division du travail social,* 1893). His discovery of "the non-contractual elements of contract" brought this distinction to a halt for him. As far as I know, he never used it subsequently. Of all the hundreds of people who created such a distinction, Durkheim alone saw through it and abandoned it. We do not give him appropriate credit.

Early in this book there is a subsection entitled "Modernization and Development—the New Paradigm" (p. 11). Professor Thomas Kuhn has taught us all to hitch up to the word "paradigm" where the less prestigious word "model" will haul all the intellectual freight aboard, but we need not pause for logomachy. Although "paradigms" are often referred to in this book, I do not recall a single clearly identified and stated paradigm.

As part of the promised "new paradigm" I expected a definition of the term "modern" or "modernization." Indices of modernization are often discussed, but I do not recall any clearcut definition of the concept. How can we tell (see page 25) what "modernization implies" when we cannot even tell what modernization *is,* except by empathy with Professor Eisenstadt?

I suppose my fundamental theoretical annoyance focuses on the word "tradition" as that term is used by Professor Eisenstadt. His index (see page 367) indicates that traditionalism is defined on page 156. I ask you to turn to page 156. There is something closer to a definition at the bottom of page 151, where we have the following quotation, "But whatever the difference between traditional societies, they all share the acceptance of tradition, of the givenness of some actual or symbolic past event, order, or figure as the major focus of their collective identity, as the delineator of the scope and nature of their social and cultural order and as ultimate legitimator of change and of the limits of innovation." But of course, by that definition, there are no nontraditional societies. No societies constitute a *complete* break with the past, no matter how radical their leaders and other members think of them as being. The problem with the word "traditional" as used in these contexts is that it is used to imply that some societies are that way and others are not. It is used as though it is a binary distinction, and that is false. There are societies whose members place a very heavy weight indeed on accepted precedent as the primary basis for legitimacy. (Incidentally, it is not true that the things done for "traditional" reasons are irrational. Given the means at their disposal, what people do for traditional reasons frequently coincides to a very high degree indeed with what it is rational to do.)

There are other peoples who, over a very much broader area of their social lives, justify performances by reference to rational scientific models, even though those are frequently spurious, but these peoples do not lack traditions. The remarkable thing about them is not that they have eliminated traditions but that they have managed to set them aside as much as they do. In the United States, for example—clearly a modern society in Professor Eisenstadt's eyes—state and local governance as presently constituted are clearly obsolete. We are not faced with a single problem, domestic or international, that has not had its solution impeded by state and local governance as pres-

ently constituted—and yet, those forms of state and local governance are supported almost entirely on traditional grounds. Consider our views of locally controlled schools, police forces, the Constitution, etc. The term "tradition" has its uses. Used as though some societies have traditions and some not—with all difficulties taken care of by ad hoc qualifications—it begs rather than answers questions. Durkheim understood this.

Nowhere does this emerge more clearly for me than in the sections on China (see pp. 261–280). For Professor Eisenstadt, terms like "traditionalistic" become synonyms for elements that don't seem to work as far as modernization is concerned. This term, along with the terms "transformative" and "patrimonial," puts robes on his and everyone else's hindsight, but all it seems to say again and again is that China failed to modernize.

To put the matter more simply, without the fancy words, the Chinese were faced with a classical problem: their requirements for high levels of coordination and control escalated at exactly the point in time that their previously existing bases for coordination and control—in this case, overwhelmingly, family stability—came apart at the seams as never before. Incidentally, without Professor Eisenstadt's advantage of hindsight, no one would have regarded modernity as the greatest threat to the Chinese. The Mongols completely conquered the Chinese in a sense that the forces of the "West" never did. Unlike the Japanese, who had a highly convertible basis for coordination and control, relatively independent of family and local political structures, the Chinese had to create a new set of controls. The leaders of the Kuomintang were not successful; the present leaders of China have clearly created such political structures. Where China will go from here remains to be seen. None of this comes out very clearly in Professor Eisenstadt's book, and he misses the point that would help him in the cases of Thailand and Japan, both of which were highly traditionalistic from many points of view. Presumably Japan was not "neo-traditionalistic" because she became highly modernized.

On page 268 we see the introduction of terms which again put robes on hindsight. No matter how radical and revolutionary the revolution of Sun Yat-Sen may look, we find out that, instead of being transformative, rational and modernist, it was nontransformative, neotraditional, and semipatrimonial. None of these terms is very clearly defined. With their qualifications, they simply mean that the regime in question was not "successful." Taiwan is a special puzzler for Professor Eisenstadt. The "success" in Taiwan, and to some extent that in Thailand, leads essentially to a conclusion with regard to his hypotheses—if one can identify them clearly—"sometimes yes; sometimes no."

On page 270, we find a reference to the relative mutual autonomy of the "social, cultural and political orders." This can only imply that it is possible for the social to be noncultural and nonpolitical, the cultural to be nonsocial and nonpolitical, and the political to be nonsocial and noncultural. Do such implications merit further discussion? Such usages lead Professor Eisenstadt further down in the same paragraph to observe, "This, of course, was also related to the fact that no church or cultural organization in China existed independently of the State." That whole way of putting things is so at variance with what we know about Buddhism that it is hard to know where to start. Yes, the Chinese government could license monks and nuns, but in no ordinary sense was there any sort of churchly dependence on the State—assuming the Imperial Chinese government to be a State. Should one even use the term "church" for the Buddhist organizations? The Buddhist organizations in a single *hsien* didn't necessarily relate to one another, much less did all of them combine into one sort of national organization or church. Professor Eisenstadt should know better than to impose Christian religious concepts on other religions. Buddhism is a puzzler for him. Taoism would be a howler, and that's not the end of religions in China. Professor Eisenstadt is so overwhelmed by what he sees in China of the elements of centralization—quite extraordinary for a relatively non-modernized society—that he almost completely misunderstands the role of decentralization there.

On page 277, Professor Eisenstadt refers to "partial groups such as families and regions." Whatever does he mean by the concept of "partial groups"? It seems to be self explanatory for him. I wish it were for me. On page 280 we have something of a conclusion about China—Professor Eisenstadt's last paragraph before going on to India. It seems that the present Chinese regime may or may not be successful in doing what the Nationalists attempted, but, either way, the Chinese heritage will prove to have been of great importance in "shaping the destiny of its encounter with modernity." Not only in China! Unless one is a mystic, the historical basis from which

change takes place is one of the most important factors in affecting the destiny of anything. (Incidentally, even in this he seems unalert to the fact that the historical base from which change took place for the Nationalists was after all somewhat different from that for the present People's Republic.)

Finally, Professor Eisenstadt's conclusions, pages 357–363, represent an interweaving of advice and analysis that is not to my taste. Taste aside, however, where I know the materials best, as in the case of China, I more often find myself in disagreement than agreement with him. I deeply regret that.

Socialism and Affluence. By The Fabian Society. (London: Fabian Society, 1967. Pp. 93. 12s.)

The Fifth Social Service: A Critical Analysis of the Seebohm Proposals. By The Fabian Society. (London: Fabian Society, 1970. Pp. 159. 30s £1.50, cloth; 18s 90p, paper.)

The Fabian pamphlet *Socialism and Affluence* was first published in 1967 and was reprinted in 1970. It is a group of four lectures, three of which were given by academics and the fourth by the late Richard Crossman a member of the Labour Cabinet from 1964–1970. Professors Abel-Smith and Townsend both make very strong pleas for larger expenditure on social services which they justify by reference to numerous social surveys recording widespread poverty amongst low earning families and pensioners. Unfortunately, the humanity and compassion which makes the works of Titmuss, Abel-Smith, and Townsend so attractive is not matched in these essays by a full analysis of the economic or political costs of providing better services to all those in need. With hindsight it is easy to see the danger of ignoring the harsh reality of economic circumstances; in 1966 the British could still delude themselves by referring to "affluence" as if American socioeconomic problems were similar to those of the U.K. The pressures imposed upon the 1966–70 Labour Government to pursue redistributive and other social welfare aims resulted not only in an increase in taxation from 36 per cent to 52½ per cent of national income (D. R. Myddleton, *The Power to Destroy* [London: Johnson, 1969]) but also to the party's decisive defeat in the 1970 election. Crossman in 1966 still had the moral courage to chide academics who could hope "that with luck the [economic] crisis should be over in a few months" (see p. 88 of Socialism and Affluence which refers back to Brian Abel-Smith's lecture, "Labour's Social Plans"); but with mounting political pressure for better social services and the organization of social welfare lobbies all efforts to curb expenditure failed.

The Fifth Social Service is a collection of nine essays published in 1970 which exemplify the gulf that exists between economic reality and the dreams of Fabians. The "fifth" service relates to the personal social services which provide for the needs of children, the elderly, and other vulnerable groups such as discharged prisoners and homeless families. In 1968 the Report of the Committee on Local Authority and Allied Personal Social Services (Seebohm Report HMSO 3703) was published and recommended very extensive changes in the organization of these services. Five of the Fabian essays constitute a critique of the Seebohm Report (essays by Peter Townsend on the objectives of the personal social services departments; Adrian Sinfield on social work, Peter Mittler on community mental health care, Michael Meacher on the needs of the elderly, and John Agate on hospital and community care of the aged).

Peter Townsend in the first essay suggests that the objectives of personal social services should be examined in the light of (1) the subjective views of consumers and experienced suppliers, (2) policy outcomes, and (3) a level of provision determined by "true objectivity." His concept of objectivity is not fully defined or operationalized and would appear to rest upon utopian ideals. The other authors develop Townsend's theme of "true objectivity" and therefore give relatively little thought to the identification of priorities or costs. Meacher supports a proposal for a one hundred per cent registration of elderly people so that they may be visited and have their needs assessed and satisfied. As most of the services are free or very heavily subsidized, the demands made by the elderly would inevitably absorb a large share of budgets intended not only for the elderly but also for other age groups. A lack of recognition of prevailing budgetary constraints is also apparent in other essays which recommend increases in expenditure without relating these to the amount of distributive justice already attained by increasing social security benefits and other services to which low-income consumers have access.

In Adrian Sinfield's essay the role of social workers is defined as the imparting of informa-

tion about rights, making services available, helping to communicate needs to those in authority, and encouraging action by the individual, family, and group on behalf of themselves and the community (p. 31). David Bull examines the difficulties encountered by voluntary workers giving information to the general public about a number of means-tested benefits administered by national and local government authorities. He discusses the political dilemmas which confront pressure group organizations campaigning for the withdrawal of selective benefits, and the introduction of universal schemes such as family allowances or higher basic pensions; and he expresses his anxiety that by increasing the efficiency of means-tested schemes, selective policies will thereby be strengthened and appear to be condoned by those who are politically opposed to them.

DELLA NEVITT
London School of Economics

Lexikon Zur Soziologie. Edited by Werner Fuchs et al. (Opladen: Westdeutscher Verlag, 1973. Pp. 783. DM 29.)

The terminological apparatus of sociology is in a notoriously parlous state. The diversity of the linguistic, theoretical, and empirical traditions which contribute to (and contend for dominance within) the discipline; the practitioners' eagerness to signal the real or claimed novelty of their contributions through the use of neologisms; the fuzziness of the boundaries separating sociology from other disciplines—all these factors make the working vocabulary of sociologists cumbersome, discordant, imprecise, ill-ordered, often obscure. Hence the difficulties (and the attractions) of the enterprise, attempted in the book under review, of producing a reference book which would register, codify, possibly order that unwieldy patrimony of terms.

Such an undertaking involves, it seems to me, two basic "design decisions." In the first place it can strive to reduce that multiplicity, order that diversity, by giving the status of entries to relatively few terms, subordinating to each of these a number of others mentioned only within the presentation and discussion of the former; alternatively, it can treat as entries as many terms as possible, instead of ordering them into sets of more or less tightly coordinated terms. In the second place such a reference work may include only terms originating and circulating primarily within sociology *as such* (however understood), or on the contrary take up any terms in use within sociological discourse, whatever their origins and (so to speak) their citizenship.

The title itself of this thick, small-format book (A lexicon not *of,* but *for* sociology); the acknowledgment in the preface of differences not just in the interests and competences, but in the theoretical, methodological and ideological orientations of the five editors and eighty-two contributors; and above all the very large number of entries (some 6,000)—these characteristics indicate that with respect to each "design decision" the *second* of the above alternatives has been chosen. This is a repertory of definitions and capsule treatments of such terms as one may come across in reading sociological literature, whether themselves specifically sociological or not; in fact a great many of those here treated as entries are primarily in use in fields as diverse as ethology (e.g., "Imprinting"), statistics ("Histogram"), political science ("Division of powers"), or philosophy ("Erfahrungswelt"). Great care has been taken to present as clearly as possible each term; much less effort has gone (intendedly and, in my view, advisedly) into stipulating relations between individual terms. Furthermore, when a plurality of definitions or usages exist for a given term, each is distinctly articulated; thus four definitions are given for "Ideology," and six for "Law," for instance; and within many entries (e.g., "Feudalism"), a broadly Marxian/Marxist usage is juxtaposed to one or more others with different systematic backgrounds and ideological resonances. Furthermore, even somewhat idiosyncratic terms, specifically identified with only one author or school, are entered; and one may in fact wonder whether in selecting these the editors may have been rather *too* permissive. It is one thing giving entries to Max Scheler's "Ideal factors" and "Real factors," but another to treat as entries Dieter Claessen's "Sequence expectation" or F. H. Allport's "Pluralist ignorance."

To continue with a few doubts and criticisms, it is unclear what criterion has been followed in treating as entries the titles of a very few books (among these "Streetcorner society" and "Soldier, American"). Non-German terms (mainly English, some French) are very frequently referred to; but again it is not clear why in certain cases they are followed by a definition (as with "Career patterns"), while in other cases they are entered but only to refer the reader to the German equivalent for a definition (as with "Contrat social"), and finally in other cases yet they appear after a German term, purely as a translation of it (as

with "Skewness"). Furthermore, though the coverage of terms is impressive, the absence of some important ones appears unjustifiable. There are numerous entries beginning with "State," but no entry for "State" itself; "Weltanschauung party" and "Cadre party" are entries, but "Party" is not one. There are no entries for "Tax," "City," "Property," "Politics," "Cost-benefit analysis," "Hegemony," or "Contract." The book has no index, presumably because it has so many entries that it constitutes, as it were, its own index; yet one might like to have listed, for instance, all the authors and books mentioned *within* entries.

To test the quality of the treatment (always a tricky matter with reference works) I have read closely many hundred entries, as varied in theme and significance as "Curtosis" and "Ethnomethodology," or "Counterculture" and "Hermeneutics," and only very few of these have seemed to me lacking in clarity, precision, or insight. I have set a question mark, for instance, against the entry "Spirit of capitalism," which of course refers to Max Weber but fails to recognize that Weber treats strictly religious elements as causally connected with that "Spirit," but not as constitutive of it. And the last sentence of the entry "*Rechtsstaat*" ("A formal *Rechtsstaat* is sometimes found in dictatorships, e.g., in Germany at the beginning of the thirties") puzzled me: between 1930–33 the German republic may have been a purely formal Rechtsstaat but was no dictatorship; after 1933 it was a dictatorship, but was it a Rechtsstaat, formal or otherwise?

On the whole I find this a well-conceived and well-executed reference work, much to be recommended to those with enough German to make use of it, and not just to resolve difficulties originating from the reading of specifically *sociological* literature.

Interpretations of Fascism. By A. James Gregor. (Morristown, N.J.: General Learning Press, 1974. Pp. 281. No price listed.)

During the past decade A. James Gregor has become the most prolific and acute analyst to be found outside Italy of the philosophic components of Italian fascism. Even within Italy his work in this regard is only equalled or surpassed by that of Renzo de Felice, the great biographer of Mussolini. The present volume follows Gregor's study of *The Ideology of Fascism* (1969) and his *The Fascist Persuasion in Radical Politics* (1974); it will be followed by Professor Gregor's forthcoming study of the political and philosophical ideas of the young Mussolini.

The study of fascism comes rather more easily in the United States than in Western Europe, for even after thirty years, detachment is hard to achieve in countries that have actually experienced some form of fascism. This is perhaps demonstrated most graphically by the recent outpouring of abuse on Renzo de Felice in Italy following the appearance of the latest volume in his Mussolini biography, together with the brief *Intervista sul fascismo* (1975). If fascism is no longer a problem of West European politics, it is still a problem for West European ideology and culture.

Some of the reasons this is so are amply illustrated in the volume under review, which is the first systematic analysis in English of the principal theoretical efforts of the past fifty years to interpret Italian fascism. Ernst Nolte's introductory essay in his *Theorien uber den Faschismus* (1967) was a perspicacious attempt in the same direction, but limited by its very brevity, while the analytical essays in De Felice's *Il fascismo: Le interpretazioni dei contemporanei e degli storici* (1970), while much fuller, lacked the systematic clarity and conciseness of Gregor's work.

Gregor has organized the attempted interpretation of fascism, with primary reference to Italy, under six general themes or categories: (1) The consequence of "moral crisis"; (2) The consequence of psychological disabilities; (3) The consequence of the rise of "amorphous masses"; (4) The consequence of class struggle; (5) function of a particular stage of economic development; and (6) a manifestation of totalitarianism. In each case he presents a brief summary of the arguments of the leading exponents of the theory, and then proceeds to analyze each interpretation critically in terms of its logical consistency and verifiability, and the degree to which it can be corroborated by the known facts of the history of Italian fascism. The result is effectively to demolish the various conflicting loose general sets of ideas that have passed for theories or interpretations of fascism.

Somewhat surprisingly, among those scholars and writers reviewed, the ones who seem to have done the best job of self-criticism and correction of the most extravagant or flagrantly inaccurate aspects of the theories of their own "school" are some of the more serious and relatively objective East European

Communist scholars of the past fifteen years, such as Alexander Galkin in the Soviet Union and Mihaly Vajda in Hungary. Western Marxists, by contrast, seem proportionately almost more disposed to repeat the hoary Marxist shibboleths of the 'thirties in unrevised form.

Gregor concludes that what we are left with does not add up to an empirically verifiable theory of fascism, but rather some loose general suggestions and ideas that merely provide the beginning of an approach to the topic, once the more extravagant and demonstrably false theories have been discarded. This conclusion is convincingly supported by direct data and rigorous analysis.

One position that is largely overlooked by this approach, though Gregor does mention it in passing, is the general skepticism shared by such diverse scholars at Henry A. Turner, Jr., Karl D. Bracher, and Renzo de Felice that such a general political category as "generic fascism" can even be demonstrated to have existed. The significant differences between the various radical nationalist movements of Europe in the 1920's and '30's were so great that it has never been easy to establish their common identity completely or systematically.

I myself agree with Gregor that such a thing as "generic fascism" did exist in Europe during the period 1920–45, though I would restrict the category simply to fascist movements rather than speaking of "fascist systems" or regimes. Mussolini himself in his final reassessment did not believe that his dictatorship had been a fully fascist regime, and the study of interwar Italian institutions largely bears him out. The Mussolini regime was a political dictatorship geared to a large degree of institutional pluralism in the nongovernmental institutions of Italian society—monarchy, army, church, business, and even to some extent the judiciary and culture. The Fascist party did not itself rule but was increasingly constituted as a bureaucracy within and under the official state, quite distinct from the structure of either Nazi Germany or Communist Russia. This would leave us with only Nazi Germany as a "fascist system"—not enough to constitute a genus.

Whether or not such an interpretation is correct, it serves to underscore the main thrust of Gregor's book: the limitations of our empirical knowledge, but above all the weakness of our conceptualization of the fascist phenomenon in interwar Europe. The clearing away of useless, obfuscatory theoretical debris is indispensable before genuine progress can be made, and in this task Gregor's book serves the study of fascist politics very well indeed.

STANLEY G. PAYNE
University of Wisconsin

The Ideological Imagination. By Louis J. Halle. (Chicago, Ill.: Quadrangle Books, 1972. Pp. xiv, 174. $6.95.)

Professor Halle has written an urbane and learned "tract for the times" (p. vii) about ideology—not ideology in general, but a particular version called "totalitarian ideology." It is a personal "speculation" that skips along from topic to topic, thinker to thinker, in pursuit of a viable alternative intellectual and political commitment, which turns out to be, antithetically, "the commitment to non-commitment" (p. 140). Continuity is provided by the author's determined attempt to account for the origins and impact of ideological thinking and the attitudes he sees associated with it: intolerance, dogmatism, bigotry, mass irrationality, and the bifurcated *Weltanschauung* of what he labels "Manicheanism." Needless to say, Halle's opposition to "ideologists," past and present, and their mode of thought and action is manifest throughout.

The argument begins with the standard distinction between the liberal's accommodation of diversity, associated with Locke, and the totalitarian's imposition of conformity, identified initially with Rousseau. The author's own "ideological" orientation is revealed by his insistence that only the latter qualifies as "ideology," strictly speaking (pp. 5–6). "Ideological thinking" is correspondingly "normative thinking so sure of its own rightness as to be intolerant of dissent" (p. 116). The road to this kind of dogmatism is marked, first, by Hobbes's "subversive" elimination of the "authority of God" in matters political (pp. 18–22), and next by the introduction of a fictional popular sovereignty, which achieves its apotheosis in the Rousseauean myth of the general will. The political utopia of Rousseau is then nicely complimented by the asocial romantic rebellion of Jean-Jacques. This unique confluence of institutional myth-making and introverted romanticism, Halle contends, is the ideological basis for all subsequent experiments in totalitarian politics and professional revolutionary careers.

From here it is a short step to Marx, Engels, Lenin, Mussolini, and the whole pantheon of ideological anti-heroes, left and right, so familiar to this genre of writing. (Paren-

thetically, Hegel is notably absent because of enlightenment provided the author by Walter Kaufmann.) Marx and Marxism stand out as the *pièce de résistance* for post-1789 developments, and also supply the subject matter for Halle's most fruitful analysis. In these passages Marx emerges as a masterful "dramatist," setting the stage of history, composing lines for his actors, plotting a suitable dénouement, winning an audience. His facts were often mistaken, his concept of human nature dangerously dualistic, his predictions wrong, Halle maintains, but he possessed the ideologist's gift to command belief. It is precisely "as a dramatic vision, not as truth" (p. 75) that Marxism and other ideologies become historically influential. Of course, Halle also believes that the rise of ideology brings about an historical retrogression, even a "general intellectual debasement" (p. 121).

Having identified the forces of darkness, Halle goes on to propose a solution for the modern age, an odd amalgam of elements seemingly from J. S. Mill, Ortega, and W. G. Sumner. It rests on a demand for more profound "appreciation of our own ignorance" (p. 131). Because our knowledge consists at best of "partial, contingent, and tentative truths, mixed with error" (p. 134), Halle argues, creation of an open marketplace of ideas becomes the only rational social policy. Hope for salvation from mediocrity and mass society then lies with "individual minds." In one memorable aside we learn that Jefferson's America and Elizabethan England "were sordid and pitiful societies except as they were exalted by the virtue of a few individuals" (p. 130)! Man, we are told, is responsible "for himself alone" and is required only to "respect the rules" that make toleration possible. The measure of seriousness here is seen in an admonition to renounce "the common commitment to raising the moral standards and enhancing the understanding of others . . . to teaching others what is right and true" (p. 145). Evidently this is what "commitment to non-commitment" means. Placed alongside such advice, Halle's final assurance that we shall all profit from studying Plato's *Apology* (attached as an appendix) appears wholly incongruous.

As the author warns in his preface, much of his speculation is "wrong"—*responsibly* wrong, as he says—yet hopefully insightful. But how responsible and insightful? Aside from obvious limits to the individualistic prescriptions, the weaknesses of the diagnosis of ideology's pathology are those of any writing in this genre: accountability of past authors is assigned with summary justice, their explicit intentions are deliberately ignored, historical and social context is set aside, and the passion for synthesis becomes an obsessive preoccupation. Important differences among writers, distinctions among ideas, and effects of non-ideological factors are simply ignored. How interesting is a revival of the discredited view that Rousseau was the world's first ideologue, in face of all else that might be said about him? Is it enlightening, not to mention plausible, to hear that Schopenhauer, Darwin, Nietzsche, D. H. Lawrence, Freud, and Sorel all assisted the "revolt against reason" (pp. 97–8)? Surely the "ideological imagination," if it exists, is no more remarkable than the reactions it provokes.

LAWRENCE A. SCAFF
University of Arizona

From Kingdom to Commonwealth: The Development of Civic Consciousness in English Political Thought. By Donald W. Hanson. (Cambridge, Mass.: Harvard University Press, 1970. Pp. xiv, 469. $15.00.)

This book has two central theses, both stated by the author in the opening chapter (pp. 39–40). It is, first of all, "an assessment of the place of medieval ideas in the achievement of constitutional government," and the author argues that "the medieval contribution was very slight." Second, it attempts to identify the "perspectives which not only contributed to the emergence of constitutional government but which also are central to its continued vitality"—summarized by Hanson as "the birth of public consciousness" in England in the seventeenth century.

As the title indicates, only English thought is considered, thus excluding both ecclesiastical and continental theory. Even in England no attention is given to the thought of Hobbes and Locke, although there are lengthy treatments of Bracton, Fortescue, Hooker, St. Germain, and Coke. The focus is on operative theory, closely related to contemporary English practice, and the argument is that there is only a very tenuous connection between "traditional" English political theory and practice before the Commonwealth period in the seventeenth century and the modern "consciousness of the public dimension" which emerged at the time and formed the theoretical prerequisite for constitutionalism. What is often mistaken for an earlier English constitutionalism, according to Hanson, is the medieval notion of "double majesty"—the belief that both the king and the magnates should

have a share in the government of England. Political authority in medieval England was personal and local. On a national level it was characterized by alternating periods of co-operation and violence between the king and the nobility—with the commons associated with them both in a minor and "distinctly subordinate" way in the late Middle Ages.

Utilizing this framework, Hanson then argues for a revision of the conventional views of pre-seventeenth century English constitutional theory. Bracton was not really arguing for the subordination of the king to the law but only for joint legislation by king and barons; Fortescue was not a theorist of mixed monarchy—because that theory is based on a differentiation of governmental functions which he did not hold; Hooker's work is "shot through with ambiguities" (p. 279), arguing at various times for the sovereignty of the king, the law, the body politic, and "the traditional doctrine of the joint supremacy of king and parliament,"; and Coke reformulated the doctrine of double majesty to apply to the relation of the common law and the royal prerogative and did not espouse either judicial review or the absolute supremacy of the common law. The doctrine of natural law provided an ethical standard which kings should observe, but not a higher law which could invalidate legislation that had been adopted jointly by the king and parliament. It was only with the assumption of omnicompetence by the Long Parliament in 1642 that Englishmen were impelled to undertake "a completely general discussion of the nature and purpose of society and government from a humanistic standpoint" and to achieve the "consciousness of the public dimension of political issues that separates the modern from the traditional political order of the Middle Ages" (p. 310).

What are we to make of this argument? The analysis of the individual theorists is careful and on the whole persuasive. Insofar as the book emphasizes the central importance of the theoretical changes in the seventeenth century, it makes a useful contribution—although, surprisingly, only one 25-page chapter is devoted to documenting the shift "from kingdom to commonwealth." There are serious problems, however, with the often-repeated insistence that medieval English political thought rested exclusively on a "traditional" notion of "double majesty" which had almost nothing to do with modern constitutionalism. The term itself does not appear in the sources, and (as the author's own conclusion on Hooker indicates) the thinkers he examines held different and potentially incompatible theories about the origin and exercise of political authority—theories which finally came into conflict in the seventeenth century. The participation of parliament in legislation and taxation was justified by all the medieval English theorists, however, because it was the corporate representative of the community of the realm, and this belief was not confined to what Hanson calls the "often hopelessly remote speculations of the sophisticated theorists of the age" (p. viii). As Fortescue noticed, this made a difference in the way that England was governed, and that difference can be described as a medieval form of constitutionalism, with "public," indeed even "civic," consciousness providing part of the justification for parliamentary participation. In reacting to the Whig "seamless web" theory of the development of English government, Hanson has downplayed the community-based elements in earlier English thought which enabled that theory to be persuasive in the first place, (e.g., Locke's quotations from Hooker). The medieval cases of royal deposition which he tries to argue away provide specific examples of the existence of an inchoate but operative "public consciousness" well before the seventeenth century. Even the civic consciousness—the awareness of one's role as citizen rather than subject—that resulted from the overthrow of the monarchy in the seventeenth century had its antecedents in concepts of community control of the ruler in earlier theory and practice (e.g., the conciliarists and the Huguenots whom the Puritan theorists cited at the time). What was novel in the seventeenth century was that constitutional theorizing (e.g., in Locke) now began with the individual, not the community. This important shift gets almost no attention from Hanson.

A final word should be said about the last chapter of the book which takes on a variety of issues that are only marginally related to its main purpose. It begins with a discussion of the applicability of liberal constitutionalism to the developing nations concluding that while a public consciousness exists among the leadership of the third world, it is unlikely that the historically particular political and ethical preferences embodied in liberal constitutionalist ideology will be adopted elsewhere. Then it criticizes a supposed tendency of modern liberalism to treat the state and government as epiphenomenal when in fact it was governmental needs and decisions that decisively shaped the course of English history and made modern liberty possible. Finally, the work con-

cludes with an impassioned defence of pluralism against the radical critics of liberalism on the left and the right. The three different topics, reflecting the intellectual history of the concerns of social scientists of the 'sixties (the book was completed in 1969), are only loosely connected with each other and with the rest of the work.

In sum, this is a provocative and original analysis which, despite some overstatement of its central theses, is useful in compelling us to reexamine and refine our understanding of the development of English constitutional thought.

Some Cambridge Controversies in the Theory of Capital. By G. C. Harcourt. (New York: Cambridge University Press, 1972. Pp. x, 272. $10.50, cloth; $4.95, paper.)

Professor Harcourt reviews a body of doctrine challenging the foundations of standard economics. The challenges, if valid, would confer increased respectability on ways of organizing production and income distribution guided more by politics and oriented less toward profit than the ways most amenable to standard analysis.

The title *Cambridge Controversies* is apt. The challenges emanate mainly from Cambridge University in England, while several prominent controversialists on the other side are based at MIT in Cambridge, Massachusetts. The English challengers are trying to resurrect and extend an approach to economic theory associated with David Ricardo and Karl Marx. They see an economy as more fully pervaded by technologically determined ratios of factor inputs to each other and to product outputs than modern orthodoxy envisages. Orthodoxy puts relatively more emphasis on how prices influence the proportions in which businessmen employ labor and other factors in particular lines of production, on how production and consumption patterns respond to prices, on price determination by supply and demand, and on the subjective element of human preferences in the market processes of determining outputs, prices, and incomes. Orthodoxy views an economy as a price system; the English challenge, more nearly as an interlocking of technologies.

Though this contrast is not of black and white, the two approaches carry different implications. In particular, orthodoxy upholds, and its English critics challenge, the marginal-productivity theory of functional income distribution. That theory sees the prices of factors of production (wage and interest rates, land rents, and so forth) as determined basically by supply and demand, with demand reflecting a factor's marginal contribution to the value of output. The theory is concerned with explaining, not justifying, the incomes of suppliers of productive factors.

In rejecting this explanation, the English critics take particular aim at the notion that the rate of interest or profit (they blur the distinction) corresponds to the marginal productivity of "capital" (in some sense or other of the word). They concoct numerical examples involving two (or more) techniques for producing a particular good. Technique A is the more economical at high rates of interest, B at intermediate interest rates, and A again at low rates. If the change from a higher to a lower rate of interest at one of the switch points brings a switch from the less to the more capital-intensive of the two techniques (which seems normal enough), then the switch back as the interest rate becomes still lower through the other switch point is paradoxical. The reduced interest rate brings adoption of a less, not more, capital-intensive technique. The whole idea of the interest rate as a price that rations a scarce factor of production seems shaken. Extensions of the analysis shake traditional notions of the productivity of thrift. The whole productivity explanation of factor prices and incomes—and with it, much of modern economic theory—runs into embarrassment.

Harcourt's book, especially if read in conjunction with *Capital and Growth: Selected Readings*, edited by Harcourt and N. F. Laing (Baltimore: Penguin Books, 1971), serves as an introduction to an extensive literature. Cambridge-trained, Harcourt inclines toward the English side of the controversy.

In this reviewer's opinion, his side is wrong. It seems enamored of paradox for almost purely destructive purposes. Yet the would-be defenders of orthodoxy have not pinpointed the exact source of error. The trouble, it seems to me, lies in searching for a purely physical conception of "capital" (or whatever it is whose yield or price is the rate of interest). The paradoxes dissolve when we recognize that the amount of that factor required in a physically specified production process does indeed depend on its own price. (Gustav Cassel aptly called that factor "waiting"—waiting for value over time. To avoid technicalities here, may I refer to my "Toward Understanding Some Paradoxes in Capital Theory," *Economic Inquiry*, September, 1976.)

The controversies that Harcourt reviews would be terribly important if they referred to the real world. Actually, they refer not to reality but to paper-and-pencil exercises, to spurious problems spawned by inappropriate theoretical concepts. Economic theory has become its own subject matter; academic narcissism reigns.

Perhaps to compensate for his highly technical subject matter, Harcourt strains to write in a sprightly style. He uses arch, allusive language. Chapters or sections have headings such as "Main bout, round one," "Mouth guards out while we arrange a return bout," and "Excuse me, Professor Kaldor, but your slip is showing." Unfortunately, attempts at humor are not the same thing as clear exposition.

Questions, Answers, Questions: From the Biography of a German Marxist. By Robert Havemann. Trans. by Salvator Attanasio. (New York: Doubleday & Co., 1972. Pp. 255. $7.95.)

This is a passionate statement on behalf of the union of socialism and freedom by a man living through their radical separation in the German Democratic Republic. Robert Havemann is "East Germany's most celebrated heretic," to use the inane formulation on the dust-jacket; he is also a most lonely heretic. Beyond his close friend, the political balladeer Wolf Bierman, and a tiny circle of kindred spirits, among them, Havemann's two sons, there is precious little. Revisionists of the older generation, such as Ernst Bloch and Hans Mayer, long ago departed for West Germany, while those somewhat younger, such as Wolfgang Harich, who was jailed for conspiratorial activities after the Hungarian Uprising, have made their peace with the regime. Havemann does not hesitate to attack the conformism of his fellow intellectuals (for example, Stefan Heym and Kurt Hager) in the face of neo-Stalinism, and in the face of his own expulsion from the Party, the Academy of Sciences and his chair as a theoretical chemist at the Humboldt University. Yet, and extraordinarily, he is neither despairing nor bitter. He grants, in a related context, that "as an old Communist I find all this especially depressing," yet an old Communist he remains. Otherwise, I think, he would be nothing.

The book, very cleanly translated, has a simple but potent format consisting of segments of Havemann's interrogation by State Security in 1966, interspersed with flashbacks to his experiences under Gestapo arrest near the end of the Second World War. Throughout, he weaves fascinating anecdotes relating mostly to Party history since 1945, and a series of succinct if often flawed discourses on the crisis of Marxian theory and movements today. The book closes with Havemann's depiction and denunciation of the 1968 trial, conviction and sentencing of his son, Frank, to eighteen months imprisonment for having distributed leaflets and painted wall-slogans in solidarity with the Prague Spring. Like his earlier political book, *Dialektik ohne Dogma?* (1964), originally a controversial series of lectures presented at Humboldt, this one has not been published in East Germany.

Havemann, it should be said, is clearly not in the philosophical current of many of the better-known (in the West) revisionists such as the Yugoslav *Praxis* group, Karel Kosik, and the associates of the "Budapest School." He is instead what might be termed a Left-wing Engelsian, that is, one who believes in an objective dialectic of nature, opts for the dynamic rather than mechanistic features of this position, and opposes on principle any "dogmatic occlusion." This begs certain questions raised long ago by Lukács's *History and Class Consciousness,* but in its East German context it is flammable enough, and one hesitates to stress its undialectical qualities.

The flashbacks to the Brandenberg-Görden Penitentiary point to the obvious question, and Havemann does not avoid it: are the differences between fascism and Stalinism significant enough to justify continued commitment to those states which call themselves socialist? As he realizes, to pose the question this way is virtually to answer it negatively, yet Havemann does not: "in spite of everything," including the "numerous practices in the GDR that, at least formally and most embarrasingly, recall the Thousand Year Reich," he proclaims the GDR a "decisively progressive step in German history"; he insists that it and other socialist states "have not irrevocably missed the connection with the future" (pp. 254–55); and that "the fruits of the Bolsheviks' victorious struggles have not yet been wholly squandered" (p. 131).

These convictions are not based—at least not in this book—upon analysis of concrete tendencies in the GDR or the socialist bloc. In fact, they appear to be refuted by the actual tendencies Havemann does see: on the one side, neo-Stalinism, and on the other—as the Chinese, toward whom he is not entirely un-

sympathetic, have said—a plunge into the waters of petty-bourgeois, Goulash socialism. Moreover, he offers two proposals for the realization of genuine socialism which, while bold, are ephemeral: first, "the semirevolution [October Revolution + Stalinism] can be made total only if the workers themselves take possession of the expropriated property of the capitalists. This means they must fight for full control over the means of production and the products produced" (p. 128). In this regard, Havemann elsewhere in the book relates his own anguished and unsuccessful attempt to talk restraint to rebellious workers in Berlin in 1953, adding that neither then nor now does he accept the official claim that the uprising was the work of the Western secret service.

If he is quiet regarding the actual prospects of an authentic socialist transformation of the GDR, Havemann is equally silent on the real chances of his second, broader proposal:

> The Czechoslovakian tragedy can lead to the tragic defeat of the whole world revolutionary movement. With fear and anguish we must contemplate the possibility of a war between the Soviet Union and China. . . . The unity of the world revolutionary movement must be restored, created anew. If a new barbarism is to be warded off, the Communists in the Soviet Union must draw the correct lessons from the events in Czechosolvakia and themselves embark upon the path they are at present fighting against with all the means at their disposal (pp. 170–171).

In both instances, between the ideal and reality lies the proverbial abyss, bridged only by the categorical imperative of the old Communist in a very bleak situation: "we must not," Havemann asserts, "succumb to hopelessness." He *still* holds to the 20th Party Congress as a beacon for rejuvenated socialism; earlier he had placed great store in Walter Ulbricht as a bearer of de-Stalinization; and he continues to see in the Czech experiment not a flicker of light decisively snuffed out, but a continuing ray of inspiration. These are at best fuzzy ideas which virtually announce the very hopelessness they were meant to overcome. Beneath them, however, lies a sensibility that is firm enough. It is crystallized in this passage, describing a small feature of one of his interrogations by State Security:

> There I was, sitting in my semicircular easy chair, which was slightly too small for comfort. These chairs with their greasy arms are like a poor man's imitation of the real thing, standing in a director's office in their hideous magnificence. I sat in a wretched little chair whose sham elegance was supposed to make it seem as though the person sitting in it was still a free man. It bothered me that my State had made something like this, that it did not find it beneath its dignity, and that I had now ended up in such a chair (p. 96).

Earlier this year, Havemann's essay, "Freiheit als Notwendigkeit," a compact critique of "consumer socialism" in the GDR, appeared in a volume on Solzhenytsin, the USSR and the Western Left, edited by Rudi Dutschke, long one of Havemann's admirers. Apparently, he was recently and may still be under house arrest.

PAUL BREINES

Marxism and Form: Twentieth Century Dialectical Theories of Literature. By Frederick Jameson. (Princeton, N.J.: Princeton University Press, 1971. Pp. 432. $15.00.)

The success of fascism and Stalinism in the 1930s dealt a fatal blow to Marxist theoretical discourse in more ways than one. Whereas the forcible repression could have been weathered, the irreparable damage to traditional Marxist schemas arising from the new developments necessitated either a total rejection or a radical reconstitution. Efforts at reconstitution have been under way at least since the outbreak of World War I, when the bankruptcy of the Second International sent people like Lenin back to the books to figure out what had happened and rethink Marxist theory from its very roots. But the failure of the middle-European revolutionary surge around 1920 and the rise of the Third International within the remaining theoretical ruins choked out the promising work of those theoreticians whose efforts were already beginning to yield interesting results. Thus, kicked out of the German Communist Party, Korsch moved to the U.S., where both the isolation and the ensuing events gradually led him away from the Hegelian Marxism that he had sought to develop. No kinder fate befell the other two major Marxist thinkers, Gramsci and Lukács. One withered away in fascist jails from 1926 on, while the other, under pressure from both the official leadership of the Communist International as well as from internal theoretical inadequacies, capitulated to the prevailing travesties of Stalinism.

The facile enlightenment idea of universal history that Marxism had inherited, which held that communism, freedom, and equality were to be found at the end of the capitalist political rainbow, seemed rather to have led to Auschwitz and Siberia. And even after the defeat of fascism, the "Free World" countries

incorporated its *content* in the very process of rejecting its *form*. The Marxism that avoided degeneration into an ideology of Stalinist legitimation, had to be qualitatively different from any mode of enlightenment thinking. Thus, those few thinkers who remained Marxists managed to do so only by carrying out theoretical reconstitutions so profound that their Marxist credentials have been under constant attack from official Communist sources during the last forty years.

What further compounds their difficulty is the growth of the "culture industry" in a social context where all opposition is readily integrated and rendered functional to the very system which it opposes. In order to prevent this, the new Marxists have had to clothe themselves consciously in a prohibitive linguistic style which has greatly contributed to their remaining unknown and largely impenetrable to scholars more conventionally trained—especially in the English-speaking world. This is what makes Jameson's *Marxism and Form* such a welcome and much needed contribution. The book provides the first comprehensive English introduction to this new Marxist tradition whose relevance has yet to be fully evaluated. Although comprising a series of previously published essays on Adorno, Benjamin, Marcuse, Bloch, Lukács, and Sartre, plus a concluding chapter on "Towards a Dialectical Criticism," the whole hangs together very well and provides a lucid systematic presentation of an extremely difficult subject matter.

The subtitle, however, is deceptive. This book is *not* a mere treatise on literary criticism but, first and foremost, a work on political theory. In fact, in coming to grips with late capitalism, Marxist categories themselves undergo a fundamental change resulting in a shift of emphasis from economics as the primary conditioning dimension, to politics and culture as the new domains of class struggle. The decline of entrepreneurial capitalism and the rise of authoritarian states (mediated by welfarism whenever possible and fascism and Stalinism otherwise) collapsed the never too sharply separated "base" and "superstructure" in such a way that the cultural arena displaced the shop floor as the focus of Marxist theory. What in political *practice* presents itself as Maoism (the primacy of politics over economics), in political *theory* becomes, at least in the West, *critical theory* (the primacy of cultural criticism over political economy). Thus, Jameson's presentation ends up by covering the entire field of Marxist theory, notwithstanding his more limited avowed aims of merely dealing with aesthetics.

Of course, there is much room for controversy in Jameson's account of hermeneutics and phenomenology, and in his latent structuralism. More painstaking analyses than can be developed in a short review will probably show significant shortcomings in these areas. Yet Jameson's deficiencies are those of pioneers: hence their positive didactic function far overshadows their character as inadequacies. The book is a must for anyone interested in contemporary Marxist theory. Whether one ultimately agrees with Jameson is not as important as what can be gained by reaching that point through four hundred pages of first-rate presentation.

Work, Creativity, and Social Justice. By Elliot Jaques. (New York: International Universities Press, Inc., 1970. Pp. 262. $6.50.)

The Harried Leisure Class. By Staffan B. Linder. (New York: Columbia University Press, 1970. Pp. 182. $7.00.)

Work in America. Report of a Special Task Force to the Secretary of Health, Education, and Welfare. Prepared under the Auspices of W. E. Upjohn Institute for Employment Research. (Cambridge, Mass.: The Massachusetts Institute of Technology Press, 1973. Pp. 262. $2.95.)

Work, Society and Culture. By Yves Simon. Edited by Vukan Kuic. (New York: Fordham University Press, 1971. Pp. 234. $7.50.)

It is hard to say which of these books is best; it is easy to say which is worst. The latter distinction goes to the collection of papers printed or read in the 'sixties, mostly in psychoanalytic journals and to psychoanalytic societies, padded by the addition of a few miscellaneous notes and articles, assembled by their author, Elliott Jaques, and published in 1970 under the title, *Work, Creativity, and Social Justice*. The data therein are old, the propositions limited (mainly to English factory workers and employees in one time and place), the theories antiquated (based largely on Melanie Klein), the language ingrown, sources few and isolated, standards low, narcissism high. The author expresses the hope that his work will be a contribution to interdisciplinary thought in art, literature, the social sciences, business and law. What the book does is reveal

how non-interdisciplinary are the author's own study and perspective.

The working population of industralized nations, has undergone a massive change in the twentieth century, moving from self-employment to wage/salary employment. The vast employment complex people find themselves in constitutes a new zone of society lying between state and family/individual, in the author's words, "The Intermediate Zone" (p. 2). The zone is organized hierarchically, perforce: in order to get work done and to make large-scale technology possible. Hierarchies, however, have not been arranged properly. As a result, work in industrial society contributes to the strengthening of psychopathological processes and to the eruption of violence. "All the conditions are present for the revival of the primitive paranoid schizoid situation" (p. 16). The industrial relations approach to overcoming these problems is grossly inadequate. What is needed is "apolitical science of the intermediate zone, with standards derived not from ethics or religion, but from the objective analysis of the nature of man" (p. 16).

What we have seems to be a political ideology in which the key phrases are work, hierarchy, conformity to consensus, equity and the right of individual appeal for same, the last being social justice. They remain, despite all claims, as the author himself said of other ideologies, a matter of opinion and political debate. It is not encouraging to see, in this work, that the application of psychoanalysis has moved so short and ragged a distance.

Three of these four books pay a homage to work that borders on devotion. The sole exception is Staffan B. Linder's, *The Harried Leisure Class*. The title is a misnomer, for the subject is not the leisure class; nor is the author interested in leisure. His main concern is time and what happens to it during periods of economic growth.

According to Linder, economists in their studies have concentrated too much on the concept of goods. When they first defined their central interest as the allocation of scarce resources, the evident problem was scarcity of goods or low productivity. Consumption, however, is not instantaneous, contrary to what standard economic theory takes for granted. Whatever is bought takes time to consume, maintain, and enjoy. "One may possibly *buy* more of everything, but one cannot conceivably *do* more of everything" (p. 83). The income elasticity of goods is not to be confused with the income elasticity of time. Their relation is not always constant and positive, as those have assumed who believed that as the general welfare increased, people would become successively less interested in further rises in income. Over the life cycle, consumption-time is inversely related to work-time and thus typically to income-producing time, as those might have pondered who have noticed that in rich countries a still higher economic growth rate has become the overriding goal of nations and individuals, the reduction in work-time has ceased, the service sector has not maintained resources, the reduction of material worries has not led to noticeable cultural advancement, and people are everywhere gasping for time.

Reduced to outline, the author's theses involve the effects of increased productivity on the allocation of time between work and non-work activities and between different consumption activities, on the volume of consumption goods, on the volume of personal (service) work, and on the quality of services. As they pass before one's eyes, one sees these effects as a procession of beggars: the deterioration of hospital care . . . the impossibly high costs of "servicing" the aged . . . the disutility of taking time to make rational decisions. And they have a new ineluctability. "We scrap old cars, but hang on to old bodies" (p. 54). How long will we continue to hang on to old bodies as the costs of their maintenance weigh heavier and heavier?

Whether the pricing mechanism does, or whether existing economic theory can, encompass the scare commodity of time is a problem the author throws down to economists. The conception of time he consciously adopts, however, time ticking off in a straight line, going from t_1 to t_2 along a continuum, running in a uniform, irreversible flow—this is the time of the world of industry, clock-time, machine-time. The author has himself adopted the work-world's "moving belt of time units" (p. 2). The conception, a simplified one, can profitably be used to add a temporal dimension to economic analysis. Deeper reflection, as the author might admit, would indicate that any culture with this conception already suffers from a shortage of time, and of space, too, exterior and interior.

This book of the Honorable Staffan Linder (member of the Swedish Parliament) comes from a tradition of economic theory. Each of the four books under review stems from a different intellectual tradition. Professor Jaques's book harks back to applied pschoanalytic theory. Yves Simon, whose book will be reviewed last, belongs to a line of Catholic philosophers,

while *Work in America* relies essentially on the methods of the American socioeconomic survey and employee relations studies of the last quarter century or so, and unknowingly, on the modern tradition of *le travail attrayant,* started by Charles Fourier, a century and half or more ago.

Work in America had its formal beginning on December 19, 1971 when Secretary of Health, Education, and Welfare Elliot Richardson charged a "task force" (why not "study group"?) with "examining health, education and welfare problems from the perspective of one of our fundamental social institutions—work" (p. xi). On the whole the report is informative and useful. It is also somewhat important because it is "trendy": it discloses the way some college professors who have come to the attention of some businessmen and government officials are thinking. The book is useful for anyone who wishes to be brought up to date on recent studies and liberal thinking about the function of work in the United States, the work problems of various segments of the country—blue and white collar, young and old, managerial, female, and minority—the physical and mental health of jobholders, the design and redesign of jobs for job satisfaction, training and retraining for jobs, and job creation objectives in federal policy with particular reference to welfare programs. There are other things to commend it for. It was put together quickly (in about a year, evidently), in a moderately conscientious way and with a certain comprehensiveness. It is at its best when it unveils dreadful facts about the health, education, and welfare of workers—the mounting of industrial accidents, overeducation and the unemployment hidden within it, the mishandling of welfare policy.

But time and again the authors bump into, only to shy away from, the fundamental ideological problem of the report—the conflict of political democracy and economic exigencies. Thus, jobs of high status are "satisfying" (p. 19); yet most old and new jobs are "largely in middle and lower levels" (p. 20). What to do to raise the bottom level to the apex of this pyramid and keep it up there? The answer is to redesign jobs at the bottom so that they look like jobs at the top. "It then becomes crucial to infuse middle- and lower-level jobs with professional characteristics" (p. 20). The execution of this magnificent *trompe-l'oeil* would make a counter-Reformation painter blanch.

The ethical problems remain: in redesigned jobs the worker does not have autonomy, nor does he participate in those decisions that affect his life. He cannot elect to raise his own pay, promote himself, pick out which days and how many he would like to work, how much money he gets in retirement and when he should begin to take it, and meanwhile who, if anybody, should be his boss.

The report refers airily to the work ethic as though it were a superstition one should outgrow with one's second teeth. Yet one would have to return to Samuel Smiles, Poor Richard, Horatio Alger, and the monastic orders to find such a richly embroidered version of the Work Society. It even improves on the idea of competition: workers now should compete not with others but "with themselves over time" (p. 144). The complete individuals can learn to convenant with themselves in schools. As a matter of fact, schools—the last redoubts of non-work activity—have to be captured. They should be looked on as workplaces like any other workplaces, "influenced by and influencing other workplaces." There should be manpower training for all. "Also, if we all could type . . ." (p. 148)!

So fierce is its focus on work that the report did not dream of considering alternative directions for America. The new cloud-cuckooland it depicts goes beyond the Work Society into the workhouse. Leisure, which offhand one might expect to have some bearing on health, education, and welfare, not to mention on work, gets a single reference in the index: "Leisure, boredom in, 88."

The tradition of leisure is absent from *Work in America,* as it is also from *Work, Creativity, and Social Justice.* In the *Harried Leisure Class,* leisure appears faintly yet convincingly. In *Work, Society, and Culture* the tradition appears but only to be summarily judged and tossed aside.

The last, and least timebound of the four works in review is this *Work, Society and Culture.* It is least timebound in the sense that more than others, it could have been read a decade ago or can be read a decade hence with equal profit.

Unlike the half-anonymous authors of *Work in America,* Yves Simon says that "we must all acknowledge that there exists in work a permanent foundation for irksomeness" (p. 32). Giving the worker a dispatch case in which to carry his lunch will keep neither his coffee warm nor his beer cold nor his job satisfaction high. The irksomeness of work follows from a definition based on Veblen's classic formulation in *The Theory of the Leisure Class:* to work is "to turn things to human use," which

in Simon's reformulation takes on emphasis: to transform "physical nature for the purposes of man" (p. 113). Physical nature has laws of its own which anyone working on it (and the worker is the one who does the working) will soon find cannot be changed to suit personal convenience. Nature except in paradise is stubborn.

Simon knows that an important part of work—the part that includes most of the pleasure it allows—is the social aspect of working together. It is this aspect of work that recommends itself to him. While work in its sociality does not have the same profundity as acts of knowing, enjoying, or loving the same thing together, "it has something else: it occurs daily and it occupies far more space and time in human life than any other activity" (p. 72). Undoubtedly the sociality of work helps shape man into a social and political animal. It also provides the basis for the solidarity of workers.

Simon likes other things about work, such as the habit of honesty that grows out of wrestling with obstinate matter. The manual worker has either succeeded or not, and cannot hide his results, whereas the artist and intellectual can conceal their cheating. He likes the seriousness of work, too. It has to be done of necessity, and is therefore in earnest. One might suspect that the author after showing so much favor to work might not be displeased to see it develop into the prevailing ideology that the other three of these books under review recognize. Simon's enthusiasm does not carry that far. As he puts it, work has brought the "prevalence of the demiurgical ideal in our societies, sometimes called materialism" (p. 186), and this is not good.

Here the author might have taken recourse to the ideal of leisure, since he himself is no stranger to the classical tradition. The author frowns on leisure because it is not serious like work; it is frilly and flowery like *les honnêtes hommes* and the dandies.

Simon's remarks on leisure are haphazard. He is more interested in opposing to work the pole of contemplation and more interested still in religious contemplation. He feels he must offer a form of contemplation to offset today's obsession with physical nature. "Our best immediate chances to begin to develop the culture with a contemplative ideal may lie in promoting collaboration between all kinds of technical work and the fine arts" (p. 187).

The few remarks on technology seem naive; but evidently a platform of naiveté may be just the place, sometimes, from which to make penetrating insights. Whoever reads this book will find many things to turn his mind to.

SEBASTIAN DE GRAZIA
Rutgers University

The Dialectical Imagination: A History of the Frankfurt School and the Institute of Social Research, 1923–1950. By Martin Jay. (Boston, Mass.: Little, Brown & Co., 1973. Pp. 382. $3.95, paper.)

This book is based not only on a very large amount of published material but also on interviews with past and present members of the Institute of Social Research; on the unpublished correspondence between Max Horkheimer, its Director since 1932, and Leo Lowenthal; on Horkheimer's scrapbooks and other unpublished documents and writings in the collections of Friedrich Pollock, Leo Lowenthal, and Paul Lazarsfeld. As a result, Professor Jay's work is indispensable for anyone interested in the intellectual activities of this circle of leftwing, bourgois radicals in exile. To a lesser extent it is also informative on the early history of the Institute under Carl Grünberg.

Professor Jay painstakingly presents the so-called "critical theory" developed by Horkheimer and Marcuse; Pollock's and Neumann's conflicting analyses of Nazism; and the integration of psychoanalysis into "critical theory," including the objections which Adorno and other members of the "inner circle" raised against Erich Fromm's ideas. The book contains also a chapter on Adorno's, Walter Benjamin's, and Leo Lowenthal's contributions to musicology, literary criticism, and popular culture, and a discussion of most of the work on prejudice and the "authoritarian personality." The final chapter deals with *Dialektik der Aufklärung*, written by Horkheimer and Adorno during the war and published in Amsterdam in 1947, as well as some other writings related to their "philosophy of history."

While the work published in English is well known in this country, other parts of the Institute's remarkable production have not received as much attention because of what Paul Lazarsfeld once referred to as "the idiocy of the Institute group," i.e., its decision to continue for many years publishing its writings in German. Horkheimer simply remarked that other refugees in America wrote English, because language served them "more in the struggle for existence than as an expression of the truth" (p. 114). Similarly, in 1942 when the Institute rejected proposals to be integrated into the Sociology Department of Columbia

University or Lazarsfeld's Bureau of Applied Social Research, Horkheimer complained, 'People don't want to [!] understand that there can be a group of scholars working under a director not responsible to big business or to mass-culture publicity" (p. 116). Surely, Horkheimer was not a happy man; in a sad letter to Lowenthal, written in 1943, he expressed his sense of isolation. At the same time he was strong-willed,' and "the inner circle" accepted his autocracy. When Ernst Kris asked Lowenthal about the Institute's attitude toward Freud, Lowenthal forwarded the inquiry to the Director for a response.

In some passages of Professor Jay's account his admiration for the work he presents goes too far. For example, he reports without a smile, ". . . even when discussing such artists as Valéry, Proust, George, and Hoffmannstahl [sic], for whom he had great respect, Adorno chose to discuss them in dialectical pairs in order to transcend the inherent insufficiency of individual accomplishments" (p. 178).

If such passages are minor flaws in an otherwise valuable study, the same cannot be said of Professor Jay's polemics: Especially, his views of the University in Exile established in 1933 by Alvin Johnson at the New School for Social Research are distortions of the truth. Without proof, Emil Lederer, the first dean of the University in Exile, is labeled "an old Institut foe" (p. 164), the Graduate Faculty itself as "the Institut's old competitor" (p. 284), and "the New School's ire" is said to have been aroused by "the Institut's Marxist tinge" and its "enthusiasm for Freud" (p. 133). This "ire" appears in Professor Jay's comments on *Studien über Autorität und Familie,* published in 1936. Professor Jay does not mention the very favorable reviews of this work by George A. Lundberg in *Social Forces,* by John Dollard in the *American Sociological Review,* and by T. H. Marshall in *The Sociological Review.* He states instead that the American academic community was slow in assimilating the "findings and methodology" of the volume "largely because of its appearance in German." But then he adds, "This process was not abetted by the extremely hostile review the work received in the New School's journal, *Social Research,* at the hands of Hans Speier," which reflected not only the aforementioned ire but also Max Wertheimer's "disdain for psychoanalysis" (p. 133). It should have been easy for Professor Jay to get his facts straight. Emil Lederer, an economist, had been close to the Austro-Marxists. While uninterested in speculation, he thought highly of Pollock's work. As far as I know, he was on good terms with Horkheimer, whom I met as a guest in Lederer's house in New York in 1936. The New School never competed with the Institute. It had a tradition of supporting radical and Communist American and European scholars before and after the Frankfurt refugees arrived in New York. Apparently, Professor Jay believes that criticism must be equated with hostility. Wertheimer was indeed critical of psychoanalysis, but this did not prevent him from offering a seminar at the New School jointly with Karen Horney as well as Kurt Riezler (who had recommended Marcuse to Horkheimer in 1932) and myself. I collaborated closely for several years with Ernst Kris, a distinguished psychoanalyst, who became a member of the Graduate Faculty at the New School. Franz Neumann, Otto Kirchheimer, and Herbert Marcuse were friends of mine, especially during the years we worked for the Federal Government. Prior to 1933, I had published many reviews in the Institute's *Zeitschrift,* and to this day Leo Lowenthal is my close personal friend. My review did not reflect any views but my own, and it was not hostile.

This is not all. Professor Jay reports that prior to publication the Institute excised the words "fascism," "communism," and "imperialist" in a manuscript submitted by Walter Benjamin. "It is abundantly clear," he concludes, "that the Institut felt insecure in America and wished to do as little as possible to jeopardize its position" (p. 205). In explaining this feeling of insecurity no sense of truth or honor restrains Professor Jay: he speaks of "the accusations of other refugees at the New School . . . previously mentioned" (p. 205). They are not mentioned.

To most of the unattached intellectuals of the Institute, political history was a subject for moral indignation, and one suspects that the everyday life of simple people was rather alien to them. Professor Jay has noticed the political myopia of the group: for many years, it denied the existence of anti-Semitism among the Germans during the Nazi period. In 1946, Horkheimer thought the Soviet Union the only country free of any anti-Semitism. Similarly, the group never felt challenged by its own theories to account for the fact that American capitalism had not turned fascist. Efforts to develop a political theory were made only by Franz Neumann and Otto Kirchheimer.

Professor Jay's book has been widely discussed in leftwing intellectual circles since its publication. Under the assumption that debate engendered by a work is a yardstick of its

merits, the book is a major contribution to social theory. Even those who do not make this assumption should readily admit that the book sheds a great deal of light on the pre-Nazi origins of certain intellectual trends in the Federal Republic.

HANS SPEIER
University of Massachusetts, Amherst

Charles E. Merriam and the Study of Politics. By Barry D. Karl. (Chicago: University of Chicago Press, 1974. Pp. 337. $15.00.)

Barry Karl's biography of Charles Merriam is excellent social and intellectual history. It is written in good evocative prose. Post–Civil War small-town Iowa, the New York of Seth Low and Henry George, the Chicago of Julius Rosenwald, Jane Addams, and Hinky Dink McKenna all come to life as settings in which Merriam sought and found himself.

Charles E. Merriam and the Study of Politics ought to have a prominent place in all those courses in which we initiate our students into the political science discipline. Merriam's life—the department he built, the students he trained and the students they trained, the research approaches and methods he fostered, the research programs he initiated, the institutions he created, the relations between research and public policy which he explored and tested—is a good part of the history of modern political science. Most of the major polemics of our contemporary intellectual life are illustrated in the problems he confronted; and something may be said in favor of the gentle and ironic way in which he usually finessed issues of this kind. An intellectually unpretentious man himself, he could spot a phony dilemma a mile away, scorned debaters' points, and sought to dissuade his students from the cultism into which their shiny new tools tempted them. If someone had told him that there were five methodological fallacies a political scientist could commit, he might have taken another sip of Scotch in the Shoreland bar and replied with his equivalent of "just as long as he loves his mother."

The father of behavioral political science was the son of that marriage of philosophy, law, and history out of which our discipline emerged, and he understood science as providing an increment of rigor added on to these older disciplines rather than an alternative to them. He took historically literate, legally and politically knowledgeable men like Leonard White and Quincy Wright and got them to look systematically at public attitudes affecting political recruitment, or the quantitative incidence of types of war over time. He gently chided Harold Gosnell when statistics carried him away, and stood in awe and bemused wonder at some of Harold Lasswell's turns of phrase and formulations. He would not have recognized our quantitative and mathematical types as *political* scientists at all; and he might have asked of the psychological reductionists who now see the limited explanatory hold personality variables have for politics, "Why this long detour?" And yet while their onesidedness might have troubled him, it cannot be said that he did not anticipate it. Somewhere in *New Aspects of Politics* is a remark to the effect that political scientists might have to lose their way in order to find it again. And he had both psychology and statistics in mind.

In a book consisting of fourteen chapters, Professor Karl devotes only three to Merriam as a professional political scientist: chapter 2, which provides a view of political science at Columbia at the turn of the century; chapter 3 on the University of Chicago and its department prior to his assumption of control; and chapter 8, which deals with the Chicago School, properly speaking. The other chapters deal with Merriam's years as a reform politician in Chicago, his role as chief of the American propaganda mission in Italy during World War I, his role in the formation of the Social Science Research Council in the 1920s, his interests in civic education at home and abroad, his leadership in what now seems to have been an early experiment in "Social Indicators"—the "Recent Social Trends" study of the Hoover administration—and finally his part in the New Deal National Resources Planning Board and the President's Commission on Administrative Management.

The bulk of the book thus deals with Merriam as politician, as institution-builder, and as research entrepreneur, and relatively little with the Chicago School and the behavioral revolution. The brief treatment of Merriam's building of the Chicago department whets the appetite for more. Actually the Chicago School, which has acquired mythic proportions in recent decades, was a quite small group of faculty and students who were creative over two decades, 1920 to 1940. By the end of the 1930s, Hutchins and those associated with him, through a combination of public scorn, affirmation of the intellectual superiority of logical formalism, and denial of promotions, had brought the golden age to a close, and shortly thereafter and quite literally put the department under the control of a committee.

The School thus was quite limited in time

and number and was dependent on Merriam's continued influence and vitality. Both had waned by the late 1930s, and Karl tends to gloss over this tragic denouement.

In his treatment of the Chicago School only the trail-breaking "Non-Voting" study with Gosnell is described in any detail. There is nothing on Leonard White's *Prestige Value of Public Employment,* Lasswell's *Propaganda Technique in the World War* and *Psychopathology and Politics,* Quincy Wright's *Study of War,* V. O. Key Jr.'s *Techniques of Graft,* and the many studies of the politics and government of the Chicago metropolitan area. The treatment of the Chicago School cries out for more substance.

In his narrative of the various facets of Merriam's career Barry Karl stresses the political maneuvering in which Merriam was the leading operator. At his best Merriam was a great intellectual coalition-maker. His earlier ventures as "reformer" and as populist in the pre–World War I period left him somewhat disillusioned and a bit cynical. He never mounted a white horse again. He combined a constant pursuit of good causes both within and outside the university, with a shrewd sense of where the resources were and how they might be brought together in winning coalitions. He was a winner in the university for enough time to give political science and the social sciences a new impulse for some time to come. He was a winner in the battle to form the Social Science Research Council, and gave national and even international scope to this vision of the social sciences. His ventures in national policy involved him in far more complicated games which he understood but could not effectively dominate. Barry Karl tells these stories very well indeed.

This image of Merriam as an institution builder and intellectual coalition maker doesn't square at all with the flat and tendentious treatment which Bernard Crick gave of Merriam and the Chicago school in his book on *The American Science of Politics* published in 1959 (Berkeley, Calif.: University of California Press). At the time that Merriam was making decisions about political science at the University of Chicago he was pluralist to the core, and he understood political parties, interest groups, the media of communication, and public opinion very well indeed. He was a man who pursued the good consistently and never lost his sympathy for the weak. But he understood what political power consisted of, and the tragic span between means and ends. And in political science, in contrast to some of those who believe they have been following in his wake, he never lost the thread of connection between a rigorous and empirical political science and the moral issues of political philosophy.

It is intriguing to speculate on Merriam's quandary in 1922 on the eve of the "Behavioral Revolution," when the offer came to take the Lieber chair at Columbia after Dunning's death. This was *the chair* in American political science, and Merriam was viewed as the natural successor to his old teacher and mentor. He had indeed half decided to accept the offer, and only wished to delay his decision while he was preoccupied with preparing the report of the Committee on Political Research of the American Political Science Association. He had unfurled the flag of the new political science in the May, 1921, issue of this journal, and was then engaged in converting his colleagues to his point of view. The probabilities are that had he followed Dunning at Columbia the profession would have gained a more conventionally productive scholar, but not the great adventurer and entrepreneur that he became by remaining at Chicago. He could bargain and get his own way in that brash and crude city of Chicago, and throw his weight mightily for a while in that university whose students—irreverent then as now—were wont to sing "Praise John from whom oil blessings flow."

Stanford University

The German Idea of Freedom: History of a Political Tradition. By Leonard Krieger. (Chicago: The University of Chicago Press, 1973. Pp. 540. $12.00, cloth; $3.75, paper.)

The German Idea of Freedom was first published in 1957. Its author is one of the many American historians of Germany whose education was interrupted by the war and finally completed in the late 'forties and early 'fifties. But the book itself belongs to a tradition of historiography which flowered in Germany after the turn of the century and was imported into the United States by émigrés such as Hajo Holborn, Krieger's teacher at Yale. Like the founders of this tradition (Wilhelm Dilthey, Friedrich Meinecke, Ernst Troeltsch), Krieger focuses on a series of major thinkers, whose ideas are seen in terms of their historical setting and influence. Moreover, the central questions which inform Krieger's book occupied all of this tradition's founding fathers: How did Gemany come to differ from the West? Why did the ideas and

institutions which helped to sustain liberal social and political institutions west of the Rhine fail to shape German realities? As the title suggests, Krieger concentrates on one strand in this complex of issues, what he calls the "peculiar German attitude toward liberty," an attitude which, he believes, persistently undermined Germans' ability to find theoretical and practical alternatives to the authoritarian power of the state.

Krieger begins his analysis with the concept of *Libertät,* "the representative expression of German political liberty in the old regime" (p. 14). *Libertät* was initially advanced by defenders of the aristocracy's corporate power, but it soon became inexorably linked with the theory and practice of state sovereignty. This linkage between freedom and the state remained the essential characteristic of the German idea of freedom, even when its social components and political dimensions changed. During the eighteenth century, for example, when "middle-class" officials moved into the vanguard of political reform, the ends and means of their efforts involved a commitment to both freedom and the expanding nexus of bureaucratic rule. In what are perhaps the finest and most fully realized sections of the book, Krieger shows how this tradition continued during the era of revolution and reform. In a series of brilliant chapters, the philosophical basis and the politics of reform are analyzed in order to demonstrate how Germans tamed and transmuted the revolutionary impetus into a bureaucratic "revolution from above." By 1815, Krieger argues, the basic typology of German liberalism had taken shape: on the left, a few radical critics of the state; on the right, bureaucratic reformers; and in between them, advocates of a constitutional "dualism" who sought a means of synthesizing popular participation and state power. At the same time, by 1815 nationalism had begun to be seen as a potentially powerful instrument for reconciling *Volk* and *Staat;* this became, as Krieger shows, an important element in the state's eventual triumph over the defenders of freedom.

The second half of the book traces the unfolding of these themes before and during the revolution of 1848, in the constitutional struggles of the 1860's, and in the new nation created by Bismarck after 1866. In the conclusion, Krieger looks ahead to the twentieth century and the experience of National Socialism, which was at once the most tragic consequence of liberalism's failure and the volcanic upheaval through which the "primal association between freedom and the traditional state" was finally destroyed (p. 470).

This summary obviously does not do justice to the range and depth of Krieger's analysis. His book, especially the first two-thirds, is beautifully crafted. His treatment of individual thinkers is always informative and provocative, even on those rare occasions when it is not fully convincing. Furthermore, his fine sense of social, economic, and political developments enables him to locate these individuals in a vividly drawn historical setting. By analyzing how external reality affects both the shape and significance of ideas, Krieger enriches the historiographical tradition within which he works. In my judgment, his chapters on Kant and Hegel are a model of how intellectual, political, social, and economic history can be joined in a coherent vision of the past. The book, of course, is not without flaws. Krieger's treatment of the period after 1850, for instance, strikes me as excessively schematic and elliptical. But on the whole, this is one of the three or four most important books on German history published by an American since 1945.

Despite its virtues, I do not think this book has had the impact and influence it deserves. It is often cited, but it has not been fully absorbed into the historical literature. Nor have those who are not specialists in German history paid as much attention as they should have to its substantive and methodological achievements. An important reason for this neglect is Krieger's style, which makes his work inaccessible to anyone unwilling to expend the time and effort a careful reading of the book requires. This stylistic difficulty, it should be noted, does not come from awkwardness or imprecision, but rather from a density which renders some passages almost impenetrable on first reading.

It is unfortunate that nothing was done to make Krieger's work more accessible in this edition. In fact, the University of Chicago Press simply reprinted the original version of 1957 without change or comment. It is also regrettable that the new edition contains no references to the work done on German history since the late 'fifties. While it is good to have *The German Idea of Freedom* back in print, it would have been even better if its reappearance had led the author to examine the relationship between his analysis and the scholarship which has appeared in the past two decades.

JAMES J. SHEEHAN
Northwestern University

Parenté et Politique: l'organisation sociale dans l'Ile d'Orléans. By Vincent Lemieux. (Québec: Les Presses de l'Université Laval, 1971. Pp. 250. $10.00.)

As the title indicates, this work explores the relationship between kinship and political life. Lemieux's central concern is with how different types of kinship structure might induce quite different kinds of political activity. Lemieux contends that such an effect of kinship on politics may be much more pervasive than has been generally recognized. Even in modern societies, politically relevant subgroups may roughly parallel kinship networks. The pattern of these kinship networks can greatly affect characteristics of the political action of these subgroups.

Lemieux proceeds to test this proposition by examining the kinship structure of a long-settled island in the St. Lawrence River near Quebec City—l'Ile d'Orléans. First, he compares the six parish communities on this island in terms of what he calls the "density" of kinship structures (as measured by the proportion of marriages that are endogamous to the parish and by the length of time that property has been held within the same family). He is able to show positive associations between the rank order of these communities along this "density" variable and their rank orders in levels of support for the federal Progressive Conservative Party and the provincial *Union nationale* party. Lemieux seeks to interpret these associations as a function of historical party policies, alleging that the policies of both parties were less prone to accentuate social differences and thus, were less interventionist than those of the Liberal Party. On this basis, he argues that these policies were more attractive to communities characterized by density of kinship ties. The interpretation is certainly provocative, allowing a greater role for "ideology" in the electoral processes of these communities than one might expect to find. At the same time, the argument might have been strengthened by more extensive supporting data—especially with respect to popular perceptions of the two parties. Lemieux's analysis is more fully persuasive when he explores the association between kinship structures and political competitiveness. Here, the aspect of kinship structures receiving the greatest attention is the proportion of marriages involving social mobility (*hypergamie de statut*). Lemieux argues that such a pattern is motivated by a social competitiveness among families that results, in turn, in a greater degree of competitiveness in the political arena. Using several different measures of *hypergamie* and of political competition, Lemieux once again finds the expected association of rank orders among the six parish communities. Finally, Lemieux seeks to show how aspects of kinship patterns affect political life in a more indirect fashion through their influence on levels of information, economic prosperity, and social solidarity. While Lemieux can show rank-order associations between kinship patterns and each of these variables, he acknowledges that in each case other factors might also have contributed to the state of the variables.

The final step in Lemieux's demonstration of the importance of kinship patterns to the political life of l'Ile d'Orléans is to construct a model to explain variations across the parish communities in support for political parties. A control is introduced for levels of long-standing party identification. The model is restricted to the remaining variation in party support. It seeks to explain this variation as a function of the relative ability of the parties to relate appropriately to four characteristics of the parish communities (all of which have been interpreted as consequences of kinship patterns). These variables are political competitiveness and the three above-mentioned variables of information, prosperity, and social solidarity. In terms of the data on party behavior that Lemieux presents, the model has a very high predictive power in each of three general elections. To this extent, Lemieux's overall thesis is sustained. (At the same time, an unknown proportion of the predicted variation may be traceable not to aspects of kinship structure but to other antecedent variables.)

Especially stimulating is Lemieux's concluding chapter, in which he attempts to relate his findings about l'Ile d'Orléans to the political life of Quebec as a whole. Lemieux contends that prior to the 1960s, Quebec was marked by a lower level of politicization than was true of the other Canadian provinces. For him, this can be explained in terms of the five characteristics of kinship patterns that he analyzed in l'Ile d'Orléans. Each of these variables, he indicates, has been less favorable to politicization in the case of Quebec. This argument does raise questions that can be adequately resolved only through further research. Nevertheless, it provides the basis for a highly suggestive interpretation of Quebec politics, offering a significant alternative to the dominant explanations of Quebec politics which have focused primarily upon the social composition and ideologies of French-Canadian

elites to explain lower levels of politicization.

In sum, *Parenté et Politique* is an impressive and highly significant work. Through an imaginative use of anthropological materials, Lemieux has developed a strikingly innovative and promising approach for the study of political life in even relatively "modern" societies. It can only be regretted that this volume, like much of the work of *québécois* social scientists, has not yet been translated into English and thus has failed to receive as widespread a recognition as it deserves.

KENNETH MCROBERTS
York University, Toronto

Prophet of Community: The Romantic Socialism of Gustav Landauer. By Eugene Lunn. (Berkeley: University of California Press, 1973. Pp. 448. $13.75.)

This is a good book, in spite of some weaknesses; it is also a timely book, because Gustav Landauer's ideal of a society without a state, without big industries and cities, organized into small communities and based on human fellowship has a close affinity to tendencies in the New Left. Professor Lunn has on the whole succeeded well in drawing a picture of the very complex mentality of Landauer, who based his anarcho-socialist ideas upon mysticism, who was a romanticist, an admirer of the Middle Ages, an anti-Marxist, a Shakespearean scholar and a historian, concerned with the analysis of revolutions. Only at a few points does Lunn's effort to explain Landauer's thinking and striving break down. Lunn, for instance, is not very successful in explaining why Landauer took little cognizance of the important developments in the libertarian movement outside Germany in the late 19th and early 20th centuries. A leading philosopher of anarcho-socialism, one would think, should have paid attention to the rise of revolutionary syndicalism in the French and Italian labor movements, to the abandonment of anarchism proper (but not of all libertarian ideas) by Paul Brousse and other Frenchmen, and to the heated controversies among anarchists in the Latin countries and in Russia about terrorism. Yet Lunn merely says that Landauer was at times "mesmerized by the conditions in Germany" (p. 207) and that he was opposed to anarcho-syndicalism because it was an urban movement. But if a man of Landauer's intellectual breadth really limited his scope so much and even failed to appreciate the tendencies similar to his own in so large a movement as the Confédération Générale du Travail, one would like to know more about the reasons.

Less satisfactory than Lunn's analysis of Landauer's personal development is his discussion of the societal framework within which Landauer had to operate. The book tries to explain the socioeconomic milieu of Swabia to which Landauer was so much attached, but the attempt does not reach far below the surface. The same is true of the milieu in Munich which became the scene of Landauer's tragic attempt to realize his ideas in the South Bavarian *Raeterepublik* of April 1919. Lunn adduces a number of important facts that could have helped to explain the relationship between Landauer's anti-urbanism and the *Blut und Boden* mystique of the German reactionary romanticists. But the effort at such an explanation remains unconvincing because the author does not have enough insight into the forces at work in Germany during the early 20th century. Moreover, he creates a semantic obstacle to an adequate analysis by applying the term "*voelkisch*" to all romantic ruralism, not only to that of the racist variety; I do not think that the term has ever been free of racist connotation, at least not since the 1870s.

Lunn deals with the great riddle of the last phase of Landauer's life: how he could have brought himself to support the Munich *Raeterepublik*. Of course, it was not the Communist *Raeterepublik*, which was established only in the backlash of the abortive Social Democratic coup of mid-April 1919, but the much milder form which had been created by left-wingers of the Independent Socialist party. But how could a man of Landauer's intelligence fail to see that in the Europe of 1919 any government of workers' councils could only maintain itself through the support of Soviet Russia and that it would therefore inevitably drift toward communism, which Landauer hated as much as Social Democracy? Lunn says that "through personal tragedies"—the loss of his wife Hedwig in 1918—"and severe disappointments with the course of the revolution . . . , Landauer had become a very impatient man" (p. 327). Perhaps not only was he impatient but also his judgment had been impaired by these circumstances; lacking a better explanation, we shall probably have to accept this as the most plausible. Landauer's assassination by "white" soldiers, however tragic in itself, spared him the pain of having to realize that for his concept of communitarian anarcho-socialism there was no room between the forces of conservatism, of the cen-

tralized welfare state of the Social Democrats, and of totalitarian communism.

CARL LANDAUER
University of California, Berkeley (Emeritus)

Engels, Manchester, and the Working Class. By Steven Marcus. (New York: Random House, 1974. Pp. xiii, 271. $8.95.)

The experience of Friedrich Engels in Manchester is a shock felt round the world, now registered as far as Moscow, Peking, and Havana, and still reverberating. In 1844, after twenty months of Manchester, full of walking and thinking about the city, Engels wrote *The Condition of the Working Class in England,* which was not translated into English until the American edition of 1887. Marcus, a specialist in Victorian literature who teaches in Columbia University, offers a work of "historical reclamation" to rescue the meaning of that text from its two inadequate English translations and to place it in a new context. He demonstrates that it is larger than a monument of socialism, wider than an interpretation of the industrial revolution, and greater than a document of urban history, locating it as an early classic in the modern-postmodern literature of incomparable extreme experience.

He argues persuasively that in Manchester, the paradigm of the modern city, the industrial revolution wrought such demoralization and dehumanization that experience passed the boundaries of language and imagination. Words failed. Convincingly, he demonstrates that the literary critic, whose domain is the whole realm of discourse, can interpret that breakdown of language and consciousness. He suggests that while Marx and Engels were busy detaching themselves from German philosophy, the very method of Hegel offered Engels a way of grasping the order of contradictions, a way to a new consciousness, and a language to represent the horrors of the industrial city. He also exposes the life, work, and personality of Engels to different kinds of analysis.

The book refreshes the context of Engels's work. It is an important study, but excruciatingly mannered. It is also inconclusive. We are led away from an interesting beginning through a disappointing middle to a place without conclusion (the last chapter is named "In Place of a Conclusion"). With all its promise, the inquiry carries the seeds of its own distraction, turning the inspection of Engels into a display of fashions that range from ethology—informing us that shelter is important—to inspirations drawn from ego psychology. The author fumbles with psychobiography, dressing Engels in the latest styles of identification and ambivalence, and rendering scant justice to the condition of Engels in 1844, or to the genesis of certain "men of a new kind"—the revolutionary critics—in the new age. The personal crises of Engels's life cycle do not illuminate his response to the collective crisis of language and consciousness, or penetrate what Marcus calls (p. 108) "the relation of writing to praxis."

Today, we may still read the surface of the city by walking the Engels trail in the streets of Manchester. If we pause near where he stood on Ducie Bridge, viewing the most hideous dwellings he had ever seen, we find the old horrors displaced by the railroad. The walls of the present bridge are too high to reveal anything but a large graffito which reads, "All Out on May Day." Since Engels stood there, language and consciousness have never been the same.

E. V. WALTER
University of Manchester, England

Patterns of Dominance. By Philip Mason. (New York: Oxford University Press, 1971. Pp. 377. $4.50.)

Race relations, undoubtedly, are one of the most meticulously researched subjects in the social sciences. Anthropologists, psychologists and sociologists, of course, have long been engaged in prolific analyses of its various aspects, and recently there has been a spate of contributions by economists (e.g., Gary S. Becker, *The Economics of Discrimination* [Chicago: University of Chicago Press, 1957]) and political scientists (e.g., Alvin Rabushka, *A Theory of Racial Harmony* [Columbia, S.C.: University of South Carolina Press, 1974]).

The issue, therefore, highlighted in this work has been treated by a host of scholars either following the trail blazed by their predecessors or striving to carve out some territory of their own. As in other fields so crowded with contributions, truly original studies have been few and infrequent.

Yet, Mason explicitly (although rather unpretentiously) aims at breaking new ground. More specifically, taking a skeptical view of inquiries in which methodological and theoretical precision are sometimes bought at the high cost of removing the analysis from total reality, he relies (in a manner reminiscent of S. N. Eisenstadt, *The Political Systems of Empires* [Glencoe, Ill.: Free Press, 1962]) on the comparative method, abstracting items from dif-

ferent societies in an attempt to find, so to speak, the "laws" of racial history. Thus:

> A lack of sufficient width seemed to me a weakness in many studies of race relations; again and again one found writers putting forward explanations for some phenomenon which did not hold good as soon as the terms of reference were broadened. . . . This book began many years ago with one simple thought. Why was the situation as between black and white in South Africa so different from that in Brazil or the Caribbean? Was it in fact so different as it seemed to be on the surface? It seemed worth trying to analyze, in various parts of the world, situations in which different ethnic groups were living together in harmony or tension, and to enumerate and assess the changing factors present in each case, trying to reach some conclusions as to why one situation was tense and another relaxed (p. ix).

The particular societies singled out for the purpose of this commendable comparative attempt comprise the African empires, Athens and Sparta, the Aztecs and the Incas, Brazil, the Caribbean, India, South Africa and Spanish America, but considerable insight is also provided into the dynamics of race relations in several other parts of the world, (both in the geographical and temporal sense). The investigation is comprehensive in coverage, often illuminating and eminently readable.

The principal contribution of the undertaking lies in its determining of the main patterns of racial dominance to have crystallized throughout the world prior to and following the European colonial expansion. The author questions the empirical validity of the sequence designed for the United States (presupposing smooth unbroken progress toward racial harmony) and establishes that racial encounters ordinarily assume forms such as complete *domination* of one group over the other (e.g., South Africa), *paternalism* (e.g., British India) or *competition* (e.g., American North). The anatomy of each of these three configurations is carefully dissected and their emergence firmly grounded in appropriate historical and socioeconomic contexts.

The presentation, however, is not without limitations. To begin with, the work is so saturated with minutiae that the reader has to stretch his faculties in order to see the theoretical wood behind the factual trees. Evidently Mason, not unlike the bulk of his colleagues at the Institute of Race Relations in London, is more concerned with generating new data than interpreting them theoretically. And in view of the frailties of some of the recent theoretical constructs, his strategy of letting the facts speak for themselves is likely to be sympathetically received in certain quarters. The general value of the study, though, would have been enhanced had he imposed on these reams of useful information a tighter analytical framework and struck a better balance between data and theory. Schermerhorn's "inductive typology" illustrates the potential of such an approach (R. A. Schermerhorn, *Comparative Ethnic Relations* [New York: Random House, 1970]).

By the same token, it might be argued that the theoretical explications resorted to in the book are of insufficient scope. There is, for instance, no dearth of reference to the writings of Banton and van den Berghe. No serious attempt, on the other hand, is made to turn to account the propositions of additional "macro-level" theorists and none of the "micro-level" ones. The writer is admirably unwilling to over-simplify a complex factual reality, but to a point of rendering it too simple (compare, for example, with Hubert M. Blalock, *Toward a Theory of Minority-Group Relations* [New York: Wiley, 1967]).

Finally, nowhere in the text is there any substantial discussion of the methodological questions involved in the study of comparative race relations. In tracing and juxtaposing the patterns of racial dominance, Mason implicitly faces problems of combining the diachronic and synchronic perspectives, deduction, induction and the like. Still, he appears reluctant to bring them into the open (along the lines of Henry Teune and Adam Przeworski, *A Logic of Comparative Social Inquiry* [New York: Wiley, 1969]).

In conclusion, the author has delineated painstakingly and vividly most of the major racial conflicts. At the same time, he has fallen short of producing a much needed macroscopic theoretical framework for his subject.

M. MUSHKAT, JR.
Victoria University of Wellington

The French Right (from de Maistre to Maurras). Edited and introduced by J. S. McClelland. (New York: Harper Torchbooks, 1971. Pp. 320. $2.45, paper.)

Race and Race History and Other Essays by Alfred Rosenberg. Edited and introduced by Robert Pois. (New York: Harper Torchbooks, 1974. Pp. 204. $2.95, paper.) (Roots of the Right. General Editor: George Steiner).

> The rule of the road is a paradox quite,
> Both in riding and driving along;
> If you keep to the left, you are sure to be right,
> If you keep to the right you are wrong.

Henry Erskine, who penned these lines, was an eighteenth-century Englishman; but his words, *mutatis mutandis,* apply in our time as well.

"Much of the crisis of identity and society that has overshadowed twentieth century history comes from an impulse towards total politics," writes George Steiner in the General Editor's Preface that opens every volume in the series "Roots of the Right." This he connects in turn with the attack upon the theory of man as a rational animal, an attack whose most radical version, using the concept of the Fall of Man, has come from elitist, racist and totalitarian dreamers and publicists of the Right. Hence these "black books" designed to provide source material concerning political and philosophical programs that have "come so near to destroying our civilization."

A good idea! But it is not quite clear what civilization this material helped to destroy, or what it did to destroy it. The strands of thought revealed or, rather, ravelled in these books are scarcely peculiar to the Right; and a useful task, not here performed, would be to disentangle them from similar tendencies that are politically neutral, or put to different uses in some other camp. The impulse toward totalitarian politics, for example, is visible in many past societies, not to speak of the present, and the modern means to satisfy it are products of technology, not ideology. Elitist views are no monopoly of the Right, from the Old Testament to *What Is To Be Done?* The basic contradictions between liberty and equality had revealed themselves as early as 1793. Nationalistic doctrine was associated with the Left (Gobineau scorned it) until a more convenient rationalization of conflict took its place. The popular mind, weaned on Christianity and envy, did not need theorists of race to suspect aliens and hate the Jews. Liberalism and parliamentary institutions were criticized by Left as well as Right, and discredited by their own failures (or successes: nothing fails like success!). The men whose texts are cited in these volumes provided not inspiration but rationalization of attitudes based on traditional prejudices and current experience.

But here is a thread to follow: "What unites the Right ideologically in France is the fundamental attack on reason and the rights of man," writes J. S. McClelland in his introduction to the volume on *The French Right,* which runs from Joseph de Maistre to Maurras, by way of Taine, Drumont, Sorel, Le Bon and Barrès, to culminate with Claudel's ode *to the Marshal* [Pétain]. Yet the attack on reason was less fundamental than he (or Steiner) claims, and it was directed not against its utilization but against its exaggeration. Taine, for whom reason, like health, is only a momentary achievement and a happy accident, wanted to put its possibilities in perspective. He simply agrees with Robert Bridges, whose

> Reason kens he herits in
> A haunted house. Tenants unknown
> Assert their squalid lease of sin
> With earlier title than his own.

That was a point of Barrès as well. As for Maurras, his belief in reason, armed with logic, subjected him to that *folie de la raison* which is the penalty of ideas carried to their logical conclusion.

It was not reason such men opposed, but abstraction. All claimed to pit liberties against liberty, concrete against abstract notions, and, as Maurras stressed, *interests.* They opposed or claimed to oppose those for whom ideas have more substance and personality than men. They did not realize that they themselves identified general interests with particular ones (connected with certain social groups or intellectual traditions); but neither did their opponents, who argued from concrete wrongs to abstract rights. All this could be quite interesting. But such complex aspects of the relationship between Right and Left are never broached; indeed, the Left is practically absent from these pages. Yet what was the Right about, if not about the Left?

The reader's bewilderment (or the absence of an indication that bewilderment might be an appropriate beginning in his quest) is emphasized by the inclusion in the series of Max Stirner, whose ideal society was a union of selfish individuals, enemies of the state against which he preached rebellion intended to exalt and to assert not a new order, only the self.

Though Stirner influenced Nietzsche and was attacked, viciously and at length, by Marx, his extreme anarcho-egoism led rather to the exploits of the *bande à Bonnot* than to those of the *fascios*. The suggestion that it provides one of the roots of the Right is certainly unorthodox. Mr. Carroll fairly admits that the case for inclusion is scarcely overwhelming, but argues from Mussolini's enthusiasm about "Stirner, Nietzsche, Goethe, Schiller, Montaigne, Cervantes, etc." We might ask why from this list of *agents provocateurs* we (or Mr. Carroll) should pick Stirner rather than Montaigne—or "*etc.*"? We would do better, though, to accept the suggestion implicit in this method, and extend the search for roots to include Karl Marx, a far less equivocal contributor to Mussolini's thought.

No student of fascism can afford to ignore the socialist (and syndicalist) roots of that radicalism which, disillusioned with the growing bureaucratization, *embourgeoisement*, perhaps humanization, of the organized Left, took up positions "of the Right." McClelland, aware of this problem, includes Georges Sorel; and also Maurice Barrès, whose youthful politics were explicitly socialist, although increasingly and, after 1896, insistently, "national." In France, but not only in France, the origins of socialism lay in nationalism, the origins of nationalism in the philosophy of reason and the rights of man. A pretty tangle of roots, worth some attention.

Nor does racism, represented by Gobineau and Rosenberg, yield a less equivocal harvest. Arthur de Gobineau, of course, elitist and anti-democrat, is properly brought forth as a source (or confirmation) of prejudices inextricably connected with a certain section of the Right. But Gobineau was no anti-Semite in the contemporary sense of the term: his Semites were negroid inhabitants of the Middle East and the Mediterranean basin, including obviously Arabs, harbingers of the historical decline that was his obsession and the major theme of his works. His elitist racial theories suggested how one could be a patriot (he wasn't) while despising one's fellow-citizens (he did). More important, though, anti-Semitism in the nineteenth century was no preserve of the Right. Quite the contrary. Gobineau's contemporary, Alphonse Toussenel, was a radical "of the Left," and passages from his *Les Juifs, rois de l'époque. Historie de la féodalité financière* (1845) would have deserved inclusion in the series. Racism, duly enhanced by Darwinist strains, was for the cultivated. Anti-Semitism was endemic in the masses. Until revealed as the socialism of fools, resentment of Jews rising to truculent hatred was characteristic of socialist propaganda right through the century (see the works of Edmund Silberner).

There as on other planes, the cry for justice, first raised on the Left, was echoed on the Right as well. In both cases, justice *for* as often as not meant justice *against*—against those who had something others wanted. Typically, the *numerus clausus*, devised in East and Central Europe against "encroaching" Jews, reappears today in the United States in the shape of educational quotas and other proportional affirmations of a "fairer" social policy. Meanwhile, Right or Left, the essence of politics remains the same: who gets what, and from whom. The rationalizations, devised to philosophize on the way to the trough or to the slaughterhouse, continue to differ.

Professor Steiner, who must know this, evidently had a deeper reason for launching his series: to show those readers who may have doubted it how excruciatingly boring such writings can be. He has succeeded. This reader at least, staggers forth from the search for roots and makes a wild grab for lighter reading—perhaps the *Critique of the Gotha Program!*

EUGEN WEBER
University of California, Los Angeles

Reflections on the Causes of Human Misery and Upon Certain Proposals to Eliminate Them. By Barrington Moore, Jr. (Boston: Beacon Press, 1970, 1972. Pp. 201. $7.95.)

This publication traditionally divides books for review into four major fields. Perhaps the most telling comment upon the work under review is that it fits into each of the categories and more. It is, indeed, global in its vision, both in the geographical sense and in the way it cuts across the traditional fields of inquiry. Yet while Professor Moore's work is in the unified social science tradition of Marx and Weber, it does not purport to provide definitive answers to the problem of human misery; rather, as the title suggests, it offers reflections and invites the concerned reader to join issue with the author on them. Few readers are apt to agree with most of Moore's wide-ranging arguments. The book's net effect upon most readers will be alternatively to enlighten, infuriate and challenge them. And, I suspect, this mixture of responses is precisely what Moore hopes will occur.

The book's central purpose is to explore the problem of that portion of human misery which

arises from institutional arrangements. Misery which stems from one's individual psyche is outside the scope of the work. While he concedes that the notion of happiness is highly relative, misery cuts across cultural and national lines and is, therefore, unitary. The four principal categories of social misery are: "(1) the ravages of war; (2) poverty, hunger and disease; (3) injustice and oppression; and (4) persecution for dissident beliefs" (p. 2). Moore's cardinal premise is that "human beings do not want a life of suffering, at least for its own sake. . . . [Therefore] human society ought to be organized in such a way as to eliminate useless suffering" (p. 5).

At the outset one wonders whether Moore's conception of human suffering as unitary is an adequate one. Clearly much suffering and its acceptance by large numbers are closely connected with institutional arrangements and social action, but it may also be inevitable or unforeseen. For example, while the scandalous failure of American society to care for many of its elderly is attributable to institutional failure, medical advance simply does not permit the alleviation of much additional suffering of the aged. But of even greater consequence is Moore's failure to note explicitly that suffering is often inextricably bound together with happiness, and is therefore much less absolute than Moore allows. For example, one may put up with and indeed relish suffering here and now in order to achieve happiness in the future. Virtually any World War II battle film graphically illustrates the point; soldiers suffer the privations of the war in order to achieve the "better world" which will surely come after the termination of hostilities.

Unfortunately for Moore's concept of unitary misery, a multitude of situations arise in which participants perceive suffering to be well worth the cost because of some gratification which will take place in the future. Further, the gratification may occur in either the realms of the natural or mystical. Moore's hypothesis thus does not aid us in responding to the difficult problem of differentiating the circumstances in which suffering should be borne from those in which it should not be. His hypothesis does not advance an argument which would, for example, help us to distinguish "good" wars from "bad" ones, and unless we accept his unconditional implication that suffering has no future benefits, we cannot join issue with Moore's *prescriptive* arguments.

The problem is further complicated by the justification often given for inflicting suffering on others, that we may be saving them from even greater suffering. Sometimes, of course, this may constitute a rank rationalization, but at other times it may largely be true. The bulk of cases in which we are called upon to make such judgments, however, are unclear in their implications. Aceording to Fogel and Engerman, Negro slaves lived better than the urban proletariat and far better than African peasants. Perceptions of these conditions might have been used in part to justify slavery. But obviously the case of slavery is far more complicated. Again, the infliction of a great deal of misery upon Vietnamese peasants by American forces has been justified by some on the ground that it saved them from worse fates. Again, the issue is complicated, and again Moore's unity of misery notion does not advance us very far in evaluating such events, even within a shared preference for altruism.

Notwithstanding one's difficulties with this central notion, Moore's book has so much substance that I would strongly urge anyone concerned with the human condition to read it and reflect upon its arguments. At times the brevity of Moore's formulations is admirable, particularly in his discussion of the conditions which may lead to revolution, a subject on which he is an acknowledged expert. At other times, however, the brevity of his discussion leads him to oversimplify the issues of a complex subject. For example, his discussion of various Marxist explanations of the phenomenon termed "imperialism" simply does not do justice to the arguments criticized; no matter how fairly opposing views may be stated, ten pages are simply insufficient to deal adequately with a subject on which volumes have been written. A reader who has examined both Magdoff's work supporting the Leninist thesis and Benjamin Cohen's attack upon it, will be grossly dissatisfied with Moore's brief treatment. Yet even here the reader will profit by some of Moore's insights.

The final chapter of the book is Moore's attempt to forecast the future of American society. Aware that "the inevitable is seldom what anybody expected" (p. 104), he proceeds cautiously in this endeavor. The four possibilities examined fit within the traditional terms "reaction," "reform," "revolution," and "chaos and near-total collapse." The chapter was obviously conceived during a period in which student unrest and radicalism were far more salient than they are in the middle 1970s. The discussion appears to be somewhat dated; the notion that youth will lead us through a social transformation is not taken seriously today. Moreover, Moore's major concerns—high mili-

tary expenditures, scientific effort devoted toward destructive ends, "compulsive and socially wasteful" forms of consumption, poverty and the failure of the public sector to provide adequate services and amenities—have become supplemented in the short period since he wrote the chapter by other crucial issues. The problems of stagflation and high levels of unemployment and the supply-demand-price issue of scarce resources, especially those providing energy, have risen rapidly to the top of the agenda. Any discussion of America's and the world's prospects for revolution, reform, reaction, or "coming-apart" would have to take these facts very much into consideration. Yet they are absent here. This is not to fault Moore, but merely to point out the dangers of such prognostication, even given the author's disclaimers.

Toward the end of this book Moore states that there are enough questions raised "to keep many scholars busy for their whole lifetime." If one views the book as raising crucial questions and providing acute insights and not answers, which is what I believe the author intended, it must be highly recommended. Moreover, it is extremely well-written, and completely free of social science jargon. One hopes that other scholars will take up the gauntlet thrown by Moore, thereby justifying Moore's efforts in providing us with his valuable book.

Governance and Population: The Governmental Implications of Population Changes. Edited by A. E. Keir Nash. (Washington, D.C.: The Commission on Population Growth and the American Future, 1972. Pp. 342. $3.75.)

In his introductory chapter to this collection of essays, Nash advises the reader not to expect many conclusions or in-depth analyses. Because relationships between demographic and political variables have been generally neglected by political scientists, this volume is primarily exploratory. Nash hopes, however, that these works will "kindle the interest of students and scholars of political science in the implications of population changes" (p. 13).

The essays are divided into three general areas: the impacts of population changes on the American political system; potential policies available to U.S. governments to reduce the population growth rate; and the consequences of population size, growth rates, and other characteristics for international relations.

Eight chapters in this volume deal with the interrelationships between population levels and distribution, the structure of U.S. governmental institutions, and the implications of these interrelations for effective representation, the efficient production of public goods, and equity in the distribution of these goods. As Professor Nash indicates, these essays can be placed within the existing debate over the adequacy of pluralism as a system of political decision making.

The inclination of most of the contributors to this section to accentuate the negative aspects of population growth is perhaps best demonstrated in Roger Davidson's analysis of population and the adequacy of political representation by the U.S. House of Representatives. Davidson concludes that there is little room to question an overall negative relationship between the increasing size and heterogeneity of governmental units and effective representation in Congress (p. 78). This conclusion is based on the deduction that if a representative has a larger, more heterogeneous population to represent, he will not be able adequately to meet the larger number and variety of demands.

Although such a conclusion may seem reasonable, it ignores some rather critical issues which might have been examined. For example, do we have any evidence that once we are at the level of hundreds of thousands of constituents per representative, it is significantly more difficult to represent 400,000 than 300,000 persons? Davidson presents no evidence that senators, who generally have much larger constituencies, are less representative than congressmen. He ignores the history of groups, especially minorities, that have turned to the President, the representative with the largest and most heterogeneous constituency, rather than to local, state, or congressional officials to secure representation. Davidson nowhere mentions the possible beneficial consequences which increased size and heterogeneity may have for the protection and representation of minority interests. Certainly Madison's *Federalist No. 10* would suggest that there may be such benefits.

The consequences of increasing population levels and heterogeneity are also important issues in the chapters dealing with state and local governments. Issues quite familiar to students of urban politics are raised in the debate over the desirability of consolidation of existing special districts and large numbers of local governmental units within SMSA's.

In possibly the best of these chapters, Daniel Elazar presents his familiar arguments for the

opportunities for both adequate representation and efficient production of public services provided by a federal rather than unitary system. He adds to his previous work by suggesting means by which federalism effectively copes with the problems created by increasing population size and heterogeneity. Along with the arguments provided by Elazar, Robert Drury presents data attempting to show that local governments have adequately responded to population shifts through changes in their expenditure patterns.

Countering the chapters by Elazar and by Drury are essays by John Grumm, Michael Danielson, and Allen Manvel who argue that the fragmented patterns of local governments encourage both inefficiency in the provision of services and inequities in the distribution of these services. Again using familiar arguments, these writers suggest that consolidation would lead to economies of scale and reverse the financial problems faced by center cities when citizens with greater resources but lesser needs move to suburbs beyond the taxing power of the core areas.

Although these five essays effectively present many of the issues involved in the debate over consolidation of local governmental units, the analysis of these issues is generally superficial. While Elazar and Danielson take completely opposite positions on the ability of fragmented versus consolidated governments to represent their constituents, neither of the authors attempts to develop a definition of representation, much less measure it. In the discussion of the efficient production of public services, expenditure data are used rather than measures of service levels or quality. In addition, no writer examines arrangements whereby revenues might be collected on a regional basis for equity reasons, but dispersed in a more decentralized manner so that neighborhoods with different preferences for various public services could have a greater opportunity to maximize these preferences.

In the section dealing with potential and acceptable population policies the most useful chapter is that of Theodore Lowi who uses his previously developed typology of distributive, redistributive, regulatory and constituent policies to show that those policies which are likely to be acceptable to either decision makers or the general public are not likely to have major impacts on fertility rates. Lowi's essay is valuable in showing that frameworks previously developed in political science may be profitably applied in the population field.

The two essays dealing with international relations are quite different both in the substantive material examined and in the quality of the work. The chapter by A.F.K. Organski and his associates is one of the best in this collection. The distinction made between a nation's total population and the portion of that population which is useful to the nation for the purposes of influencing actions in other nations is a useful contribution to the literature. In sharp contrast to the Organski et al. chapter, is the essay by Robert North and Nazlie Choucri. Their contribution appears carelessly written and inadequately documented. (For example, the reader is told that "the correlation between China's violence behavior toward the Soviet Union is .89" [p. 266]. The reader is not told, however, how this correlation was produced, to what time period or events it refers, or what other variables, if any, are controlled.) The inadequacies of this chapter are especially unfortunate because North and Choucri develop important questions concerning the complex interrelationships between population characteristics, natural resources, and international conflict. Since their chapter in the Commission Reports is a preliminary analysis of data which they are currently analyzing in greater depth, it can be expected that their later publications will be more clearly and carefully written.

In summary, Nash's warning concerning the general lack of depth in the analyses presented in the volume is certainly appropriate. Nevertheless the volume is useful to political scientists in at least two ways. First, the essays remind us that Plato, Aristotle, Rousseau, and many of the utopians were correct in assuming that the population levels and characteristics of a citizenry are important in determining a government's representative potential. And second, the essays make clear that in almost every subfield of political science demographic variables must be included in our theories and models, and their omission seriously weakens the potential contribution of our work.

R. KENNETH GODWIN
Oregon State University

Anarchy, State and Utopia. By Robert Nozick, (New York: Basic Books, Inc., 1974. Pp. 334. $12.95.)

Anarchy, State and Utopia is a salty pemmican of candor, argumentative wit, brilliant language, reactionary naughtiness. It is, above all, stunningly simple. One examines the pages again and again to make sure that Robert Nozick has indeed offered up a philosophy of state

whose main argument is, in its intricacy, roughly on par with an ordinary mousetrap:

(1) people have some inviolable rights of person and property (cock the spring),
(2) any state which tries to do more than protect these rights must use means, such as taxation of earnings, which violate some of these rights (latch the bar),

so that,

(3) only "minimal," rights-regarding states are legitimate (snap!)

The mice whose necks fall to this device have scampered about the pantry for a long time. In constitutional form, Nozick would bring us back to an idealized eighteenth-century state, concerned to protect the voluntary ebb and flow of market towns, unconcerned by the misery of dislocated (or merely incompetent) workers, unrevulsed by vulgar prejudice, tolerant of economic inequality, unconcerned by market-determined inequities in the essentials of medicine or the frills of child-rearing. His analysis would likewise liberate us from the nagging criticism of souls like Jefferson (e.g., the Declaration), Marx, the Fabians, Tawny, Fanon, Mao, even John Rawls and his detractors. Most of all, Nozick's theory promises to free us of the suspicion that we should use state power to amend the inequalities of income and property worked by the market. We are given the libertarian slogan,

From each as they choose, to each as they are chosen (p. 160),

by which the author evidently intends,

From each as they choose *within the limits of wealth and income,* to each as they are chosen *by those with wealth and income.*

The central implication is that one is *entitled* to whatever he earns or inherits under the rules of market capitalism. If the ends cannot justify the means as Lenin would have it, then the means can on Nozick's telling justify the ends. Justice concerns itself not with *what* you have but with *how* you got it. Both moral philosophy and the state are enjoined to let the market work its way. This is, so far as I can see, the book's main point.

Why does an argument so simple (so stubbornly unresponsive to our trouble, so blithely *innocent*) read so well and win for itself such acclaim in American life? I can think of three answers, each partial and incomplete.

First, the book is comforting. We—the "we" who bestow literary and intellectual acclaim—are creatures of modest privilege in market society. One needs no vulgar Marxism, only common sense, to see a seductive *liaison* between ourselves and the libertarian right. What a marvelous book it is which attacks both the Internal Revenue Service and the whining moralism of our recently departed students. I must, for example, admit smiling at the look of my June payroll stub on Nozick's view that, "Taxation of earnings from labor is on a par with forced labor" (p. 169). And it is fun to think about applying some tincture of Nozick to the federal bureaucracy. These titillations have their reality, but it would be wrong and unfair to credit the book's success to them alone.

A second thought: the book is in fact a subtle and compelling analysis of the state and its problems. It is true that the main thesis sketched out above is accompanied by several companion arguments, some of them interesting and at least one of them genuine. Some of these are interesting without being relevant. Nozick asks us to wonder whether man can look upon animals as his (edible) inferiors without risking the prospect that some still cleverer race will eventually look upon (eat?) him in the same way. This (like his analysis of "experience machines") is a chilling moral joke. Here, and in his good-natured *badinage* with the reader (e.g., p. 87), Nozick is a charming companion. But if the book is to cash any deep philosophical claim, it must do so in connection with one of three themes:

(1) *The side-constraint theory of rights:* Some rights, notably those which protect person and property, are to be given absolute value. Government is to do what it can without *any* infringement of these rights, without any "utilitarianism of rights," under which one right (say, open housing) is traded off against another (say, the right to sell or not to sell a house as one pleases). This is, of course, just a restatement of the book's main argument: How does Nozick justify it? By reference to the individual's inviolability and by the way market voluntarism corresponds on its surface to the Kantian requirement that each be treated as an end in himself.

This, however, assumes that markets *do* treat persons as ends in themselves; This is a mixed truth in the best of cases (in every transaction, each of us is *both* end and means), and it is simply false if some of us occupy the position of marginal labor in an unregulated economy. There is a hint here about the book's third and deepest appeal: It assumes away our worst

trouble, here by ignoring the vulnerability of persons who lack market leverage.

(2) *The hidden-hand derivation of a minimal state:* Beginning somewhat vaguely with a Lockean state of nature, each of us wants to protect what he possesses from aggression by others. Protection becomes a commodity, sold by competing firms or associations. Eventually, a *de facto* monopoly is arrived at and transformed into a minimal state which protects everyone's rights *de jure*. Given the author's strictures, the process of development is arrested here, and further state power never comes into being. Hence, the minimal state is explained and justified.

This is, I think, twice defective as an exercise in justification. First, we are never convinced that the process of development as given holds any justificatory force. Second, the story as Nozick tells it assumes away the major reasons for a more-than-minimal state. Imagine what would become of the "hidden-hand" if either: (i) there were a proletariat which had nothing to gain from protection and everything to gain from anarchic change, or (ii) there existed a subpopulation, X, (say, Blacks or Jews or heretics) which was hated and despised by another subpopulation Y. In either case, a demand would exist not just for defense but for *aggression*, and nothing like Nozick's result could be expected. No noncoercive solution would present itself in these less equalitarian cases. I draw the inference that Nozick sees no need for a redistributive, nonminimal state precisely because the cleavages which provoke the demand for such a state are assumed away. A third thesis seems to me more genuine:

(3) *The Wilt Chamberlain critique of end-state theories for allocation:* Suppose we adopt some principle which, like Rawls's difference principle, judges social allocations good or bad by their net results (end-states) without regard to the historical path by which these results are achieved. Then suppose someone, like Wilt Chamberlain with his basketball, devises a way to make a bundle of cash not given him in our end-state distribution at T_1. By T_2, the rest of us will have happily paid up, Wilt will be rich, the T_1 allocation destroyed. It seems to follow that we must either abandon our principle or renege on the freedom to dispose of one's just share.

This is a deadly serious problem. It is no newer than the old story of freedom versus equality, but it is not less deeply problematic. Its shadow is readily discerned by the meddlesome compromises of welfare policy by government (e.g., A.F.D.C.). Its implications for political economy in general are numerous, complicated, and important. It needs facing, and Nozick forces it upon us with wit and candor.

This is not to say that Nozick himself entirely escapes the dilemma. His minimal state argument presumes the caveat that earnings are properly won, and (one infers) that earnings are not arbitrarily denied. But suppose we switch from the Chamberlain example to the very different cases of Satchel Page and Jim Thorpe. It is not that they earned too much but too little, and they earned so little because of raw and simple prejudice worked out in the marketplace. Here, as before, Nozick assumes away the arbitrary and unjust effects of market life which precede the just demand for state intervention. This, in addition to its moral comfort and its intrinsic quality, is a third major appeal of the book—it invites us to assume away our trouble. To finish: this is a finely crafted work, ultimately too optimistic to suit our case.

DOUGLAS RAE

Yale University

Welfare: The Social Issues in Philosophical Perspective. By Nicholas Rescher. (Pittsburgh, Pa.: University of Pittsburgh Press, 1972. Pp. 186. $7.95.)

American welfare policy has tended to be the province of economists, sociologists, and professionals in welfare practice. The field badly needs philosophical treatment, especially in relation to democratic theory. This admirable book provides such a treatment in outline. It is an individual and original statement nonetheless well connected to the work of other philosophical social theorists, primarily in Britain. Political scientists will find its clarification of concepts distinctly helpful for the analysis of policy and implicitly suggestive about the political conditions of the "welfare state."

Starting with ordinary language Professor Rescher defines welfare as, primarily, the requisites of personal well-being in physical health, material circumstances, and mental or emotional condition. He insists on distinguishing welfare from happiness; welfare simply consists in certain "consensus requisites" of happiness. It is a profile (not a single, central tendency) of its several components. Thus, as a subject of policy, it comprises several categories

in each of which the aim is to sustain a sufficient minimum condition subject to objective statement and evaluation. The attributes of minimality (Rescher's term) and objectivity are critical both in defining and limiting state responsibility; and, in Rescher's view, they permit the direction of large sectors of welfare policy by social indicators. Although the justification of a sufficient modern welfare policy lies in social interdependence and "system malfunctions," the focus of welfare policy can be posed in terms of personal needs, not "wants," that are "socially actionable"—i.e., mensurable and administrable.

Issues of method—for example, the relative roles of income supports and social services—are not much considered here, but Rescher's succinct discussion of conceptions of poverty (Chapter 6) is easily worth the price of the book for anyone supporting a family of four on an academic salary. The most general methodological recommendations—that increasing productivity is politically preferable to pure redistribution, as is indirect promotion to relief, and that the comprehensive provision of sufficient welfare is economically feasible in modern, affluent societies—are conceptually unexceptionable, though they leave a host of technical difficulties unaddressed. But *Welfare* is not intended as a technical treatise in social policy. The critical issues for Rescher have to do with values and their rational malleability. A society whose members will internalize the welfare of others through the recognition of interdependencies and the pragmatic common understanding of needs can resolve or obviate numerous technical issues of welfare. "Beyond the welfare state" the trick is to transcend *distributive* welfare through *collective* welfare "regarding the publicly shared conditions of our common environment."

Thus it turns out that the "welfare state," ministering to welfare as Rescher has defined it, presents some inevitable disadvantages: a negative, categorical emphasis on disaster prevention rather than life enhancement; a growing threat of centralization and state control; a utilitarian economic preoccupation; an endemic failure to redeem the dependent population on which it concentrates rhetorically; and a set of malign side effects for initiative, responsibility, authority, and contentment. Rescher is arguing, as he observes at the outset, that men tend to misjudge their own welfare despite (or because of) its proper limitations and distinction from "happiness," and that democratic political and administrative measures necessarily tend to default on welfare. The policies of a postwelfare state and the values of a postindustrial society would entail the substantial dismantling of centralized welfare bureaucracy while sustaining the appropriate minimal elements of welfare. Indeed, Rescher argues—or, at least, asserts—they *will*. Here the argument takes a familiar postindustrial turn in its prognosis of a "positive" politics of improvement, satisfaction, and quality of life; an altered balance and articulation of governmental and voluntary action; "a new emphasis on the subcultures, regionalisms, and parochialisms of a pluralistic society. The forging of social cohesion amid the multiplicity and variety needed for a full life in a mass society is beyond doubt a central problem of the postwelfare state" (p. 175).

For Rescher this argument is more than prognosis; it is a diagonsis of our present condition. The frustrations of the welfare state are ineluctable; the advocated transformation of the welfare state is, while apparently not inevitable, nevertheless desirable and consistent with certain emergent welfare-state values. The argument is schematic, leaving qualifications and negations to the imagination; but it is not at all an argument of radical perfectionism, and it amply suggests the tensions of tomorrow implicit in the politics of today. Among many such arguments, that of this book is particularly worth attention. Its conclusions are debatable, but its perspectives on the substance of "welfare" and its emphasis on the elements of "value" in the politics of welfare are important.

CHARLES E. GILBERT
Swarthmore College

The Government of Poland. By Jean-Jacques Rousseau. Translated by Willmoore Kendall. (Indianapolis, Ind. The Bobbs-Merrill Co., Inc., 1972. Pp. xxxix, 116. $6.00.)

Rousseau's *Government of Poland* is an important but little-read part of his works. Kendall's offering is thus a real contribution to the literature of political theory.

An outstanding merit of this offering is Kendall's own fine introduction. The translation to which it is keyed is adequate but not particularly outstanding. Kendall's essay is nearly one third as long as the translation it introduces and, since most of its interesting points refer to that translation, its relatively pedestrian quality is disappointing. But in my opinion, the introduction by Kendall, together with the scarcity of translations of the work, make the whole offering well worth reading.

Kendall's introduction, "How to read Rousseau's Government of Poland," is both subtle without being obscure and precise without being dry. Its peculiar charm is, perhaps, that in it Kendall manages to demonstrate his points without insisting. He does this by showing us how he reads Rousseau, rather than by lecturing us on how we ought to read Rousseau. This is not to say that his conclusions are, or ought to be, universally agreeable to the concerned student of this relatively unknown work —a work which Kendall, correctly I think, calls, "this pearl of great price" (p. xviii); but, even when we disagree, either with a particular point made or, as is more likely to be the case, with the scope of applicability claimed for a point made, we note a combination of quiet reflectiveness and quick canniness which is encouraging to the tyro in these studies as well as sobering to more advanced students.

Kendall's treatment is more than broadly reflective, however, since it is also learned and detailed. We find here a refreshingly straightforward presentation of the quite complicated system of election-electors-voting mechanics, etc., in operation in Poland during the period addressed by Rouseau's text. Kendall's presentation of Poland's factual (a) militiary situation (p. xix), (b) imperative mandate (p. xx), (c) system of elector-selection (xxi-xxii) and, (d) federal machinery (p. xxii) is terse and crystal clear.

After having laid out the historical constitution of the historical Poland of Rousseau's lifetime, Kendall then shows us that Rousseau's *Government of Poland* does not address itself substantively to any of these characteristics of the historical Poland's historical regime. His address to the *oddness* of Rousseau's gift to a "Poland" which is far different from the historical Poland whose regime Kendall describes so clearly is very provocative, and this point is then used to provide a soberly persuasive groundwork for his central thesis that the *Poland* is to be read with extreme care if its true purpose is to be grasped. That true purpose, Kendall argues, can be seen best by a consideration of Rousseau's thoughts concerning the children of Israel under Moses; these were to become the dispersed, displaced Jewry which, without a homeland, was still a "national" people 2 millennia later (xiii). Kendall argues that Rousseau envisages the Poles groaning under the Russian yoke as constituting the new Jews—which suggests, if we may be permitted to follow out Kendall's thought further, that Rousseau ironically enough presents himself in the *Poland* as a new "Moses" to the Poles in the Russian house of bondage, and the *The Government of Poland* is presented as a new *"Exodus."* Kendall's argument encourages us to wonder whether perhaps Rousseau does not here indicate a future evolution of all of Europe into a congeries of Swiss-like federations of relatively autonomous cantons. This quite distinct possibility made good sense out of Rousseau's text of the *Poland* in critical places; without it, we are led to wonder if after all—as Rousseau himself so modestly suggests —Jean-Jacques is not accurate when he says of himself (p. 2) "Now, . . . I am barely able to tie one idea to another. . . ." Kendall's argument leads to the likelihood that Jean-Jacques Rousseau is thinking very well indeed, and that he wishes to teach each of the "enchained" peoples of Europe to be, so to speak, a new "Jewry" until all the other, hitherto oppressive "Philistines" or "Egyptians" become liberated from what in them makes them foolish enough to undertake self-destructive expansionist wars, (see chap. XII, pp. 79-81). Under Kendall's reading, Rousseau is a new Moses to the Poles and a new St. Paul, at the very least, to the militarists of his Europe.

And finally, before a word on the translation, we must mention Kendall's remarks relating the *Poland* to the *Social Contract* as Plato's *Laws* are related to *The Republic* (xvii). The notion of the *Poland* as supplying Rousseau's practical *"morale provisoire"* to his theoretical *Social Contract* is a most provocative one—since it adumbrates what is perhaps *the* political phenomenon of the non-Western blocs, i.e., infinitely "socialized" peoples being thereby prepared for a millennium lacking any social impositons.

Kendall's translaton seems less vigorous and pointed than his commentary. On p. 7, (Pléiade, III, 957), we find Rousseau praising Numa as the true founder of Rome. Kendall makes two sentences out of one and in the process quite badly misemphasizes the original, a critically important statement of Rousseau's. Kendall has Rousseau say that Numa *first* united the members of Romulus' robber-band to one another and all of them to the soil by means of certain mild institutions; and that Numa *then* made the city sacred using apparently frivolous rituals. Kendall's translation has:

> He did this by transforming the robbers into citizens, not so much by means of laws, however—of laws they had, in their rustic poverty, scant need—as by mildly restrictive institutions that bound each of them to the rest and all of them to the soil; and, finally,

> by making their city sacred in their eyes by means of those rites, apparently idle and superstitious, whose strength and influence so few people have understood. . . .

The correct emphasis is:

> He did this by transforming them into citizens, less by laws . . . than by certain mild institutions which attached them to one another and all of them to the soil by means of finally making their city sacred. . . .

That is, Rousseau says that these robbers were transformed into citizens through (*par*) certain mild institutions which bound them together and to the soil *because finally* Numa rendered the city sacred—*en rendant enfin leur ville sacrée*. . . . (Cf. *Social Contract*, I, Ch. VI for a definition of *ville* and *cité*.) In this crucial passage of the *Poland*, the problem is precisely for Numa to render, finally, *une ville*—a village —into *une cité*—into a city.

For Rousseau, a city *is* a village rendered sacred and, ultimately, Rousseau's ambition, if we may judge from the *Poland*, is to be the new Numa to Europe.

Historians of Modern Europe. Edited by Hans A. Schmitt. (Baton Rouge: Louisiana State University Press, 1971. Pp. 338. $11.00.)

Historians of Modern Europe is a collection of thirteen essays by former students of S. William Halperin. The authors, with one exception, currently hold academic posts in American universities. The exception, Pierre Renouvin, is at the Sorbonne. In the introduction, the editor, Hans A. Schmitt, describes the book as part of the University of Chicago tradition of presenting to a retiring, esteemed professor a "*Festschrift* with a theme" (xviii). Schmitt also provides a brief summary of Halperin's academic accomplishments.

The theme of *Historians of Modern Europe* is historiography, meaning here the study of historians rather than the methods of historians, the philosophy of history, or even the history of historical writing. Each of the thirteen essays is about a different historian. The book is divided into two parts: "Anglo-American Perspectives", with essays about Arnold Toynbee, Carlton Hayes, Oscar Halecki, Hans Kohn, A.J.P. Taylor, and J.L. Hammond, and "Continental Perspectives" with essays about Adolfo Omodeo, Gaetano Salvemini, Federico Chabod, and Gioacchino Volpe (Italian); Gerhard Ritter (German); and Ernest Labrousse and Jacques Chastenet (French). Each of these historians lived in the twentieth century and wrote at least one essay about modern European history.

Unlike *Ideas in History*, edited by Richard Herr and Harold Parker, a previous volume in the Chicago tradition, *Historians of Modern Europe* does not have a conclusion. The introduction does not mention the thirteen essays, and one must infer from the dedication page and the tradition that the authors are former students of Halperin's. The essays are not related to each other and are not uniform in the subjects they treat. In short, the book lacks unity. Each essay must be taken on its own merits.

Edward Whiting Fox discusses Arnold Toynbee's paradoxical commitment to prophecy and free will and Toynbee's resolution of the problem by distinguishing between "sub- and self-conscious action" (p. 9). Carter Jefferson describes Carlton J.H. Hayes's belief that the "idealism of the masses causes war, not economic imperialism or combative instinct" (p. 20). Hayes justified his belief on the grounds that nationalism produces international anarchy (his phrase) which was the "general cause of World War I" (p. 18). Kenneth Lewalski shows how Oscar Halecki resolves the dichotomy between the specific and the general by maintaining that only the "triumph of the kingdom of God and the end of time" are "predetermined" (p. 60), and those general ends are unspecifiable.

Perhaps Louis L. Snyder's analysis of Hans Kohn's treatment of nationalism will most interest political scientists. Kohn maintains that there have been many different types of nationalism which need to be distinguished from the current deterioration of nationalism into a kind of "primitive pagan tribalism" (p. 68). H. Russell Williams criticizes A.J.P. Taylor's *Origins of World War II*, while Henry Winkler surveys the "historical achievement" (p. 119) of J.L. Hammond in defending the idea that the industrial revolution made worse the conditions of the working classes in Europe.

The four essays on Italian historians emphasize the connection between history and politics, particularly the treatment of Italian unification and the rise and rule of Benito Mussolini. Charles Delzell's essay on Adolfo Omodeo, A. William Salomone's on Federico Chabod, and George Peck's on Gaetano Salvemini describe academic opponents of fascism who helped bring about the Republic. Edward R. Tannenbaum finds that Gioacchino Volpe willingly embraced fascism. Volpe's accommodation to the regime cost him his post after the defeat of Italy in World War II.

William Harvey Maehl's essay on Gerhard

Ritter depicts the fascinating way responsibility for the emergence of Hitler is translated into an historiographical controversy about Bismarck. Ritter opposed the Nazis while defending Bismarck against the charge that he prepared the way for Hitler.

William Savage portrays Jacques Chastenet's attempt to understand the fall of France in 1940 as a loss of faith resulting from the accomplishments of a patriotic objective—the recovery of Alsace-Lorraine at the end of World War I. Pierre Renouvin's study of Ernest Labrousse describes the popularity of the *Annales* school in France and it's emphasis on social-economic history. Labrousse's four volume *Economic and Social History of France since the 16th Century* is typical of this school in its focus on internal social conflict as the principal, but by no means the only, cause of domestic and international policies.

This book would be of greater interest to political scientists if it had a conclusion. Such a conclusion could have been built around the historians' different uses of inevitability, their working resolution of such problems as that of "presentism," or their contribution to twentieth-century historiography. As they stand, these essays will probably be of greatest interest to readers who want to know the historian before they read his history.

The Writings of Henry D. Thoreau: Walden. Edited by J. Lyndon Shanley. (Princeton, N.J.: Princeton University Press, 1971. Pp. 409. $10.00.)

The Writings of Henry D. Thoreau: The Maine Woods. Edited by Joseph J. Moldenhauer. (Princeton, N.J.: Princeton University Press, 1972. Pp. 486. $12.50.)

The Writings of Henry D. Thoreau: Reform Papers. Edited by Wendell Glick. (Princeton, N.J.: Princeton University Press, 1973. Pp. 403. $13.50.)

The first three volumes in the new Princeton collection of *The Writings of Henry D. Thoreau* surpass all existing editions of these particular Thoreau writings in both content and quality. Indeed, their publication is the fruition of attentive scholarship at its best. For those interested in the political philosophy of Thoreau, the respective editors of these volumes have restored purity to the manuscripts, insofar as possible, and have aided considerably in renewing an interest in Thoreau. Approved by the Center for Editions of American Authors, the volumes are prepared according to the Center's guidelines of copy-text, which are to produce the author's writings as closely as possible to his intention—i.e., unmodernized texts that would have met with his approval. The respective editors, all of whom are acknowledged scholars in the field of American literature, display meticulous and exhaustive editorial skills. All of the writings are appended with indexes, historical and introductory essays, textual notes, and where appropriate, tables of emendations and variations. No interpretation of Thoreau's philosophy is attempted.

It is an understatement to say that Thoreau's writings are more relevant today than when first written, offering refreshing inquiries of the hyperactive technocratic society. But Thoreau also furnishes alternatives by providing an intellectual handbook for purposeful living, not simply a retreat from civilization. Rather, he promises a life of deliberate simplicity designed to allow everyone to share in the products of nature as well as to liberate the psyche from crass materialism. Thoreau may not be the savior for postindustrial society but clearly he must be consulted in developing norms for its political guidance.

Walden, of course, is Thoreau's classic and most comprehensive expression of his philosophical assumptions. The editor, J. Lyndon Shanley of Northwestern University, reviews the cosmopolitan appeal of *Walden,* pointing out that previous editions have been translated into more than twenty languages. Thoreau worked on *Walden* for approximately eight years from 1846 to 1854. Hence, it is perhaps his most carefully developed work. It is the single best record of philosophical underpinnings—his basic tenets of transcendentalism, individualism, economics, society and politics.

Much of the commentary on Thoreau concentrates on his deification of nature and his political individualism. Yet most commentators fail to link the two. Indeed, the pristine physical environment is fundamental to Thoreau's thought as the real-world reflection of higher laws. It provides the raw material for the physical needs of life as well as important intellectual and spiritual lessons. Similarly, nature is the reflection of diversity and freedom, values to be emulated in political society. Political individualism for Thoreau, however, is not possessive individualism allowing for an unrestricted appropriation of nature. The acquisition of food, shelter, clothing and fuel—"the necessaries of life"—are justified by "whatever, of all that man obtains by his own exertions, has been from the first, or from

long use has become, so important to human life that few, if any, whether from savageness, or poverty, or philosophy, ever attempt to do without it" (p. 12). Material possessions are thus essential only to satisfy basic physical needs. Possession beyond these needs is a violation of higher laws and contributes to an economy of waste. Consequently, property held unnecessarily also is a violation of the natural rights of those seeking sustenance.

Thoreau makes few explicit references to the state in *Walden,* but he clearly establishes his complex relationship to the state both in his refusal to pay taxes and consequent imprisonment and in his dictum that the individual must be obedient "to the laws of his being, which will never be one of opposition to a just government, if he should chance to meet with such" (p. 323). Obviously, Thoreau is not in opposition to all government but only to those not in conformity with his notion of justice, a matter of individual conscience.

The Maine Woods, edited by Joseph J. Moldenhauer of the University of Texas, consists of three essays based on Thoreau's journeys to the Maine wilderness. Written sporadically over a fifteen year period (1846–61), it includes "Ktaadn," "Chesuncook," and "The Allegash and the East Branch." Essentially a detailed record of his journeys, the essays are frequently overlooked by political theorists in their assessment of Thoreau. Although much of *The Maine Woods* may be politically irrelevant, what does emerge of significance is Thoreau's endorsement of positive governmental actions. In "Chesuncook," Thoreau, learning that the state of Maine had voted to grant money to each school district for providing a water-trough by the roadside to be used by travelers, responds: ". . . a piece of intelligence as refreshing to me as the water itself. That legislature did not sit in vain" (p. 88). Thoreau concludes "Chesuncook" by arguing for the establishment of "national preserves" for the purpose of protecting against the commercial exploitation of the wilderness. These explicit expressions of support are rare indeed for Thoreau.

Reform Papers is edited by Wendell Glick of the University of Minnesota at Duluth. Included in this volume are eleven of Thoreau's essentially political essays: "The Service," "Paradise (To Be) Regained," "Herald of Freedom," "Wendell Phillips Before Concord Lyceum," "Resistance to Civil Government," "Slavery in Massachusetts," "A Plea for Captain John Brown," "Martyrdom of John Brown," "The Last Days of John Brown," "Life Without Principle," and his heretofore unpublished essay, "Reform and the Reformers." Although the latter essay never received Thoreau's finishing touches, Glick felt it was near enough to completion to be included in the volume.

In "Reform and the Reformers," written before 1845, Thoreau does not focus on a particular political problem but addresses the matter of reform in general. The reformers, as distinguished from conservatives (whose heads have "a puny and deficient look"), are those people attempting to change established norms and institutions—political, social, or religious. While Thoreau admires their zeal and agrees that "something must certainly be done" to correct the servile condition of humankind, he maintains the reformer is not much more credible than the rest of the ignorant masses. Thoreau asserts that the reformer preaches reform because of his own personal failures or weaknesses. The real prescription for reform, to convince Thoreau, is the deed. Not until the reformer can demonstrate "a small specimen of his own manufactures" (p. 184) is the reformer worthy of a sympathetic audience. Clearly, one of Thoreau's "specimens" is resistance to the State; in its most forceful form, resistance is revolution. And here, "Reform and the Reformers" provides an important and relative perspective to Thoreau's notion of revolution: "Most revolutions in society have not power to interest, still less alarm us, but tell me that our rivers are drying up, or the genus pine dying out in the country, and I might attend" (p. 195). Given the role of nature in his world view, it is not surprising to find Thoreau supporting revolutions in behalf of the natural environment.

There is a great deal more to Thoreau's political ideas in these volumes (particularly *Reform Papers),* all of which emanate from a superstructure of nature. But no single label is an appropriate representation of his thought. Only a strange mosaic of impressions begins to explain his brand of politics: transcendentalist, theist, temperate revolutionary, individualist, libertarian, humanitarian and pragmatist. Obviously, more of Thoreau's political philosophy is found in his other writings, particularly his journal entries. Should forthcoming volumes in this new collection be of comparable scholarship (as it appears they will be), political theorists will have new and authoritative material to work with. Indeed, the Princeton edition of Thoreau's writings is a welcome tribute to his political ideas.

DAVID M. ATKINSON
Pacific Lutheran University

Politics and Deviance. Edited by Ian Taylor and Laurie Taylor. (Baltimore, Md.: Penguin Books, Inc., 1973. Pp. 217. $2.10, paper.

Inheritors of a Marxist tradition in social science have revealed how an explicitly political body of research and theory might confront an under-laborer conception of theory and research, shaking the latter from its prepolitical slumbers. The Taylor collection is an addition to that literature; it contains eight original essays designed to correct the belief that deviance is an individual pathology by showing how it can be judged properly only by considering the goals and outcomes of laws and customs rather than by examining only what societies define as deviant. Genuine deviance entails inegalitarian goals and outcomes injurious to people's physical needs and human dignity. In essays on such diverse subjects as: excesses of heroes in mystery stories, the psychiatrist's defense of tradition on college campuses, lawful and unlawful crimes among American corporations, and self-conscious deviant actions among hippies and the Weathermen, the contributors expose current standards of deviance and criminality as reflections of the ideology of the powerful.

Constructing the basic criterion of deviance on a measure of social injury, the essayists still leave the meaning of the concept a puzzle. If one takes seriously the contemporary argument that man has no essential or given nature, then there may be no respectable way for one to judge the goodness of the new conditions, or to know that the claims of progress are genuinely more humane. In the absence of a principle of humanity, it is hard to determine which kinds of criminality are justifiable and which are not, because they are injurious to a person's humanity. It is difficult to know if current practices should be called deviant because they are socially injurious or socially injurious because they are deviant. One is forced to retreat to political or conventional claims about justice and injustice or criminality. Such claims and their limitations are to be found in the opening of Plato's *Republic*. If criminality is only a set of conventions, then any empirically based theory of deviance will only reflect some set of customary practices or political values.

The essays were initially papers read at an annual National Deviancy Conference, over a period of six years, beginning in 1968. The Conference was a forum for those social scientists committed to raising the political consciousness of students of deviance. The language of the essays is designed to appeal to both the reason and emotions of the reader. One technique used by some essayists is ridicule, accompanied by minor exaggerations and simplifications. My understanding of ridicule is that its effectiveness depends upon being able to touch those weaknesses in an opponent about which he is likely to feel sensitive, and when combined with some form of exaggeration, its effectiveness depends on its ability to shock one's opponents into moderating their objectionable practices. This advice is found in treatises on rhetoric and can be found in operation in the work of even such a sober political thinker as Machiavelli. Disappointingly, the ridicule and exaggeration in the Taylor collection are more viscous and lacking in grace. Even a reader sympathetic to the writer's position is not likely to find the efforts succeeding in their aims. For example, it seems to me to be heavy handed for writers on deviance to defend their own theoretical and empirical efforts by calling current research by others not sharing an ideological bent, deviant and inherently spurious. Two other minor difficulties are worthy of note. On occasion an author will admit the unavailability of adequate hard data to support the argument of the essay. Moreover, there does not appear to be a consistent use of the term "ideology" among the various papers.

There may be no way to delineate clear criteria for deviance that would soften the vicious character of labeling people as naturally different. One might even be drawn to conclude that all discussion of deviance in a contemporary context is, in theoretical terms, indistinguishable from silence, and that the subject of deviance is ineffable and thus a matter about which there can be no legitimate theory. One may counter such exaggeration in considering vigorously the arguments presented in this volume edited by the Taylors. The essays present a concerted effort at understanding a most complex subject, and, as such, constitute a testament to the concerns of contemporary social scientists for an escape from ideology, in its original sense. By reminding us all how the character of present political systems are revealed in the ways they demarcate the bounds of normalcy, this book reveals its most significant virtue—it leads the theoretically-minded reader to consider more completely such questions as: Is it true that all political societies rest on a foundation of perpetual crime? Is there some similarity between changes in definitions of deviance and the process of middle-classification? Is age, both in

individuals and polities, a significant independent variable in explaining the way deviance is defined? And what are the necessary elements for a philosophically justifiable theory of deviance?

MARTIN PLAX
Cleveland Heights, Ohio

Campaign Finance in America. By David W. Adamany. (North Scituate, Mass.: Duxbury Press, 1972. Pp. 274. $4.50, paper.)

Professor David Adamany has provided us with another carefully researched and highly informative study of campaign finance. Although the book's title (*Campaign Finance in America*) claims too much, for this is primarily a study of political finance in Connecticut, the book is more than a narrow monograph on a single state. Adamany is an experienced and knowledgeable student of campaign finance, and this book represents an extension and enlargement of his earlier work in the field, especially his excellent study of Wisconsin. Moreover, the author's empirical interest is guided by both a theoretical and comparative perspective that places his discrete findings in the widest possible context.

The book is divided into eight chapters: an introductory theoretical chapter; four descriptive chapters analyzing campaign costs, the allocation of campaign monies, and the sources of campaign funds; three chapters exploring regulatory problems and public policy issues. The study begins with a theoretical overview of the role of money in the political process. Borrowing from Dahl's resource theory, and supplementing it with concepts from exchange and incentive theories, Adamany views money as an important political resource which politicians use to influence the specific choices or strategies of others. Because it is so easily converted into other resources and transferable from place to place, it is one of the most useful ingredients of political combat. Yet, as he correctly notes, money is only one of many political resources, and there is little evidence to support the commonly held view that money is the basic determinant of electoral victory. Money's effectiveness depends on how wisely politicians exchange it for other resources or use it as an incentive for political action.

The core of the book consists of an intensive analysis of campaign finance in Connecticut based on empirical information gleaned from campaign finance reports for the years 1966 and 1968. Every effort is made to broaden the findings by placing them in a comparative context. Meticulously the author explores the overall costs of campaigns in Connecticut, and while he finds that these costs have risen sharply (from 20 to 40 per cent annually), he argues that it depends on one's perspective whether they are to be judged too high. If these costs are evaluated in terms of the total wealth of our society, then they seem to be a small price to pay for democratic selection of our leaders. Indeed, it might be argued that our elections are underfinanced. But if these costs are viewed from the perspective of the politicians who must raise the money from private sources, these costs might be considered as exorbitant. This latter view has obviously led to recent legislation on how much candidates can spend.

After demonstrating the sharp increase in campaign expenditures, the author undertakes an examination of some factors which might explain these rising costs. In a simple and direct way he explores the relationship of the following factors to spending: constituency size, campaign technology, price level, political organizations, and electoral competition. He concludes that "a review of the elements determining the level of political expenditures suggests that most are related to changes in the social or economic structure of the society, to political circumstances beyond the control of individual politicians, and to changes in technology" (p. 77). Unfortunately, most of this analysis is purely descriptive, merely demonstrating that there is an association between these variables and spending. It does not "explain" the variance in spending in any statistical sense. With variables that can be operationalized, it might be more useful to develop a statistical regression model and actually find out how much of the cost of politics can be explained in these terms.

How politicians allocate money among the various items of expenditure and why they choose these spending strategies are little understood. The relative effectiveness of mailers, newspaper ads, and television, is widely disputed among politicians. It has been said, facetiously, that although half the money spent on campaign activities is wasted, no one knows which half. Adamany shows that situational factors such as size of district, density of population, congruence of media areas with political boundaries, incumbency, and electoral strength introduce considerable regularity in the political expenditure patterns of candidates.

Adamany's discussion of the policy issues raised by the American system of political finance should be required reading for every reformer interested in improving the present

situation. In the last two years since the completion of this book, the federal government and forty or so of the states have adopted new campaign finance regulations. While on the whole the old laws were mostly ineffective, many of these recent statutes are based on the false assumption that money buys elections or that it is the root of all evil in politics. As Adamany correctly points out, any controls over campaign finance should be designed to sustain, not restrict, legitimate campaign activities and to expand, not limit, political competition.

JOHN R. OWENS
University of California, Davis

The Presidential Character: Predicting Performance in the White House. By James David Barber. (Englewood Cliffs, New Jersey: Prentice-Hall, 1972. Pp. 479. $5.95, paper.)

It is very much to the credit of James David Barber that in his *The Presidential Character* he tries to break new ground by shifting the focus of discussion in political science from institutional or role analysis to the interaction of "character, world view, style, power situation, and climate of expectations" in determining presidential performance. Since terms such as "character" do not admit of universal definitions, and since, further, Barber attaches special and sometimes shifting meanings to certain words and concepts, the reader cannot always evaluate for himself the predictive interaction of the key variables, or assess their individual weights, in specific cases. But overall, "character is the way the President orients himself toward life—not for the moment, but enduringly" (p. 8). "World view," on the other hand, refers to a president's "primary, politically relevant beliefs, particularly his conceptions of social causality, human nature, and the central moral conflicts of the time" (pp. 7-8). "Style," by no means the same as "stylishness, charisma, or appearance . . . is how the President goes about doing what the office requires him to do. . ." (p. 7).

The interactions of character, worldview, and style with the "power situation" and "climate of expectations" determine and are even predictive of presidential behavior. They also make possible comparisons between presidents organized in terms of what Barber calls "baselines" of "activity-passivity" and "positive-negative affect." If I understand Barber correctly, he has in mind here not so much a fourfold table with each box scored simply plus or minus, but a scale, the values of which display a considerable range of possibilities. Between the extremes of activity and passivity, Barber notes, "Presidents array themselves on the high or low side of the activity line" (p. 11). The other "baseline" of "positive-negative affect" refers to "how [the President] feels about what he does. Relatively speaking, does he seem to experience his political life as happy or sad, enjoyable or discouraging, positive or negative in its main effect" (p. 11).

Applying these "baselines" to the presidents, Barber includes among the "active-positives" Franklin D. Roosevelt, Truman, and Kennedy. Wilson, Hoover, and Johnson, the "active-negative" presidents, revealed in their performance a "contradiction . . . between relatively intense effort and relatively low emotional reward for that effort" (p. 12). The "active-negative" president is "ambitious, striving upward, power-seeking. His stance toward the environment is aggressive and he has a persistent problem in managing his aggressive feelings. His self-image is vague and discontinuous" (pp. 12–13). Barber regards Taft and Harding, the "passive-positive" presidents, as "receptive, compliant, other-directed . . . whose life is a search for affection as a reward for being agreeable and cooperative rather than personally assertive" (p. 13). Finally, the "passive-negative" presidents, Coolidge and Eisenhower (the latter so classified with certain reservations), are those "who do little in politics and enjoy it less. . ." (p. 13).

It should be interesting for the reader of this review to pause now and ask himself two questions: (1) Where did Barber, whose book apparently was written in late 1971, place Nixon on his performance scale?; and (2) Where would the reader himself, applying Barber's "baselines," place Nixon *now*, that is, from the vantage point of 1976? Barber in 1971 viewed Nixon as an "active-negative" president—although, as was the case with Eisenhower, not without qualifications—and almost five years later, I, at least, if I confined myself to Barber's typologies would not challenge that designation. Indeed, it is all the more remarkable that *The Presidential Character*, which is not free of major weaknesses, was extremely accurate in predicting Nixon's performance in the remaining years of his White House tenure. Certainly, one can argue with this or that interpretation of a president's behavior in office, but with the exception of Gary Wills, no one before Watergate came as close as Barber to penetrating Nixon's character armor and delineating the inner dynamics of his *modus operandi*. Barber's comprehension of the essential Nixon necessarily re-

lates to his concept of the "active-negative" president, but the "fit" of concept and man is so close as to suggest that the concept could almost have been developed with Nixon in mind, and indeed almost a quarter of the book is devoted to Nixon.

Consider, for example, Barber's description of the "active-negative" character as "an accumulative personality, one which tends to experience compromise as an erosion of the ego. . . . The process takes time: the frustrations of power pile up slowly but steadily, until the temptation to reassert one's integrity and manhood by some adamant stand becomes irresistible" (p. 418). Or:

> With his remarkable flexibility regarding issues and ideologies, Nixon can be 'defeated' any number of times on specific questions of policy without feeling personally threatened. His investment is not in values, not in standing fast for some principle—although, if he were to stand fast, his doing so would certainly be rationalized in terms of principle. His investment is in himself, and Nixon's self is taken up with its management (p. 442).

Or even more:

> "Threats to his independence in particular—the sense that he is being controlled from without because he cannot be trusted, because he is weak or stupid or unstable—will call forth a strong inner response. . . . Only when a crisis gathers around him, one he cannot escape by moving on to some alternative crisis, and he experiences a sense of entrapment is he likely to move toward the classic form of rigidification" (p. 442).

Certainly this 1971–72 assessment of Nixon is impressive, even taking into account the fact that Barber did not foresee, any more than any one else foresaw, the rigidifications of Watergate, the diversion of campaign funds to personal expenditure, and the income tax returns. And if Barber in the end turned his back, so to speak, on his own analysis in writing that Nixon after re-election in 1972 would have before him presidential "models of heroes" in pursuing virtue rather than power, thereby implying that Nixon might yet become a great president, so did many another political scientist foreswear Nixon's unsavory political history in supporting him against McGovern. While there were features of Nixon's involvement in Watergate that were unprecedented even for him, the lying and cheating, the evasiveness, the sordid money-grubbing, and the attempt to manipulate public sentiments and emotions were hardly new.

Perhaps the principle merit of *The Presidential Character* is that it emphasizes the importance of character structure in political behavior, whether or not it develops typologies that are useful in understanding and predicting presidential performance. As Barber himself notes, the typologies require a good deal of further refinement, but since the presidency exists in an increasingly uncertain and chaotic world, it is far from clear how far they can or will be refined in the direction of accurate prediction. Unfortunately, such refinement, quite apart from the world situation, is not promoted by Barber's use of language that is exceedingly loose and imprecise where it is not downright folksy or whimsical. A question that asks whether a president experiences political life as "happy or sad, enjoyable or discouraging" is poorly phrased. One suspects that Barber took pains not to write his book in the language of pedantic academese, but he was not careful enough on the other side to avoid a breezy conversational and occasionally overdramatic form of expression. Terminological precision, we all need to remind ourselves, is the enemy of neither creative thinking nor felicitous writing.

But even had Barber fully satisfied the requirements of methodological rigor and clarity of expression, he would have failed to capture the complexities of character that surfaced during the presidency of Nixon, most of which were unpredicted and remain unexplained. For it is the training of the clinic, not of the academy, that provides at least some understanding of Nixon's behavior, and insofar as the Nixon presidency serves as an introduction to future presidencies, the newer as well as the traditional approaches to that institution cease to be relevant. It is not that Nixon was a liar and a bungler, or that he swore more than his predecessors; other presidents have lied and bungled, and Johnson probably used as many four-letter words off-the-record. Nixon may have been the first White House incumbent who endeavored to become rich by corruptly exploiting his position, but what makes the Nixon presidency truly unique is the climate of paranoia that permeated the White House and clouded the thinking of Nixon and his closest associates. It was a climate that generated the worst suspicions of opponents and critics, and produced opinions that were guarded even in their estimates of friends. It was also a climate that did not hesitate to bend the Constitution, laws, and customs of the land to Nixon's own use, which use included the systematic abuse, on a scale still not fully known, of the powers and prerogatives of his office. Finally, it was an angry climate of vin-

lictiveness and the relentless pursuit of those stigmatized as the enemy, a climate that treated politics as a war in which there are no atrocities, no victims, no regrets—only winners and losers.

For these reasons alone, it seems both incorrect and unfair to place Nixon in the "active-negative" company of Wilson, Hoover, and Johnson, although there is a sense, *not* Barber's sense, in which Nixon was both active and negative. "The loss of the leader in some sense or other," Freud wrote in 1922 (Sigmund Freud, *Group Psychology and the Analysis of the Ego* [New York: Liverright, 1949; first published 1922], p. 49), "the birth of misgivings about him, brings on the outbreak of panic . . . mutual ties between the members of the group disappear, as a rule, at the same time as the tie with their leader. The group vanishes in the dust. . . ." That the United States has been moving in this direction for some time, partly as the result of successive crises of the presidency, and that the Nixon debacle vastly accelerated the move, seem all too apparent.

ARNOLD A. ROGOW
The City University of New York

Military Manpower Procurement: A Policy Analysis. By Steven B. Canby. (Lexington, Mass.: Heath-Lexington Books, 1972. Pp. 320. $12.50.)

Faculty seminars of the Harvard Institute of Politics have produced some genuine contributions to our discipline. Now a 1967 seminar on Selective Service has led to this thorough and excellent policy study.

Readers, however, should be forewarned. This is a reference book for researchers and serious students of the subject. The book has all the grinding efficiency and functionality of a Rand study (parts of it were) or a tech manual for an M-60 tank.

Students from many disciplines who dabble in policy analysis will want to examine this book even if they do not read it from cover to cover. For it is an example of first-rate policy analysis which makes it painfully clear why such analysis is more talked about than done. It requires data, analytical skills, an unflagging thoroughness and a "white paper pragmatism" few of us possess. Nor are publishers battering down professional doors to publish books like this. (Heath-Lexington deserves credit.)

The essence of the book is simple; the analysis exhaustingly complex. Chapter I sets forth 17 criteria for assessing the relative merit of alternative military manpower procurement systems. Chapter II, which Professor Canby rightly feels is the heart of the book, discusses the criteria in detail and uses them to assess six alternative procurement systems: selective service; voluntarism; lottery; universal service; sequential service; and mixed systems.

The basic framework that underlies Canby's analysis and the 17 criteria for assessment is drawn from Samuel Huntington. It posits that viable military policies must rest upon an equilibrium of contending national security needs and domestic demands. The resulting dynamic tension is often expressed by juxtaposed concepts like "nation in arms" and "maintaining a strong, scientific and economic mobilization base"; or by "equal treatment" vs. "differential treatment based on state needs."

It was the loss of just such an equilibrium which led to the effective demise of the Selective Service and to analyses by Canby and others.

The criteria for analysis and evaluation of procurement alternatives are comprehensive, examining virtually every facet or aspect of military manpower procurement. The footnotes and relevant bibliography will be particularly useful to students.

The conclusion Canby draws is that some methods of procurement meet certain criteria better than others. Which criteria should be met and therefore which procurement system is appropriate depends on the circumstances: total mobilization; limited war; or peacetime deterrence. Logically then the ideal system would be a gear shift or sequential system that permitted moving from one to another to match conditions.

Unfortunately, Chapter 2, which is so central to the book, is unnecessarily "heavy going" in spots. For example, "The draft subsidy (or externality) places society at point 1 on the lowest shown Scitovsky community indifference curve. If all the inefficiencies and externalities could be removed, society could reach the social optimum of mutual tangency at point 5 on the highest attainable Scitovsky curve" (p. 15). It may be a little unfair to cite the quote without the chart, but not very.

I was puzzled by the bases for some assertions or conclusions. For example Canby asserts that "The five most important criteria are manpower demands, industrial production, budget cost, ex-ante equity, ex-post equity" (p. 62). These might indeed be the most important but it depends on whom you asked. How the author reached that conclusion is not clear. He makes no claim that his preceding analysis led him to it.

There are some small publishing flaws that are particularly annoying to someone using the book for reference purposes. The type face used on subheadings is inconsistent, as is the numbering of appendices.

The other chapters in the book are really ancillary to the first two. Part two (chaps. 4-7) are, as the author says, "highly specialized" (p. xix). Each is important and useful but less so to casual readers than to students of some special aspect.

Chapter 3 explores the claims and counterclaims for exemptions and shows that deferments, in anything but a total mobilization like World War II, create more costs and problems than they solve. Chapter 4 is a short but esoteric discussion of factors to be considered in "costing out" military manpower. Chapter 5 is an in-depth treatment of the existing military pay system, its budegtary costs, and the costing of a volunteer military. The constant influx of cheap draft-induced labor, efforts to raise professional pay over the years, and poorly perceived income-in-kind to professionals led to a badly skewed military pay system. No one, not even the careerists and retirees whom the system relatively favored have been satisfied. The author insists that this picture can be reversed and better aligned with civilian practices at lower costs than most economists and the Department of Defense have estimated.

Chapter 6 considers the budget cost of a volunteer military. The author claims that his estimates ($2.1 to $2.5 billion) are much lower because of a methodology that considers long-run cost implications. Chapter 7 is a short one reviewing the faulty assumptions and the air of unreality in which decision makers in military manpower have operated since World War II. It re-emphasizes the book's dedication to re-establishing a lost equilibrium between military and structure and domestic goals.

Canby himself may have provided the best characterization of his work in an off-hand and ingenuous remark on the Harvard faculty seminar! "In recent years several groups and authors have come forth with menus of domestic goals related to military manpower procurement. The most famous has been the Marshall Commission; the most comprehensive, the Harvard faculty seminar on selective service." The same can be said of Canby's book. It is certainly the most comprehensive work on the subject to date.

GARY L. WAMSLEY

University of Kansas

For Peace and Justice: Pacifism in America, 1914–1941. By Charles Chatfield. (Knoxville: University of Tennessee Press, 1971 Pp. 447, $11.95.)

For many years accounts of interwar pacifism have been one-sided and polemical. According to analyses offered during the Cold War period, such doctrines as universal disarmament and mandatory neutrality merely proved that pacifists were intellectually incapable of confronting the facts of international life after 1918. Even treatments of American churches rejoice in the triumph of "political realism" and the consequent waning of a "utopian" anti-war stance. It was the philosophy of Reinhold Niebuhr, not that of A. J. Muste, that was celebrated by both "action-intellectuals" and historians.

Only as a result of the Vietnam trauma have historians taken a more dispassionate look. Now, for the first time, scholars are beginning to look carefully at how pacifists themselves perceived the events of the 1920s and 1930s. The author is eminently qualified to make this reexamination. He has written several seminal articles, serves as an editor of the Garland Library of War and Peace, and recently was president of the Conference on Peace Research in History. Now, in his first book, he offers an unmatched account of the interwar peace crusade.

Chatfield begins by showing how World War I transformed a broadly based peace movement, radicalizing the pacifist wing and making it far more alert to issues of civil liberties, imperialism, commercial competition, and war profits. Forced to challenge the Progressive doctrine of inevitable progress, pacifists—as early as 1918—started to ask whether some forms of conflict might be necessary for reform. In some cases, they saw war resistance itself as a means of social change.

In his second part, the author traces the history of the new activist peace organizations (such as the Women's International League for Peace and Freedom, the Fellowship of Reconciliation, and the National Council for the Prevention of War) emerging from the Great War. Chatfield shows the interlocking directorate of these peace societies, as well as prominent pacifist activity in fostering trade unionism, the rights of blacks, civil liberties, and democratic socialism.

Chatfield then turns to the ideology of pacifism, revealing how quickly such war opponents adopted "revisionist" and "devil theory" interpretations of World War I. During the interwar period, pacifists continually sought

total disarmament, debated class war, wrestled with Gandhian doctrines of nonviolence, and affirmed that military struggle resulted from unequal distribution of world markets and resources.

In the last part, the author indicates how pacifists worked with isolationist Congressmen in fostering the Neutrality Acts and the Ludlow Amendment. Only in 1939, with the advent of World War II, did pacifists abandon broad coalitions and concentrate upon reenforcing their own constituencies. Henceforth, and during the Second World War, pacifism was forced to look inward.

Skillfully combining intellectual and institutional history, *For Peace and Justice* may well go down as a classic. The portraits of peace leaders are deftly drawn, and political and ideological trends are handled with skill. Although Chatfield writes with appreciation of the pacifist movement, he always preserves his detachment and treats Niebuhr as appreciatively as Muste and peace lobbyist Frederick J. Libby. Seldom have the manuscripts at the Swarthmore College Peace Collection, oral history projects, and unpublished dissertations been used to such advantage. The extensive bibliographical essay is definitive.

The book does contain some flaws. Occasional spelling mistakes are irritating, factual errors even more so. On p. 321, for example, there are three misstatements concerning the founding of the America First Committee. (In all fairness, it should be noted that the paperback edition, published by Beacon in 1973, corrects many of these mistakes). The organization is not always clear, often jumping from event to ideology without sufficient transition. Chatfield usually refrains from appraising varied pacifist positions, although he is one of the historians best qualified to comment and evaluate them.

In sum, however, *For Peace and Justice* will be consulted frequently—and deservedly—for years to come.

JUSTUS D. DOENECKE
New College, University of South Florida

Discrimination, Personality, and Achievement: A Survey of Northern Blacks. By Robert L. Crain and Carol Sachs Weisman. (New York: Seminar Press, 1972. Pp. xiv, 224. $9.95.)

Comparative Studies of Blacks and Whites in the United States. Edited by Kent S. Miller and Ralph Mason Dreger. (New York: Seminar Press, 1973. Pp. xiv, 572. $18.50.)

Both of these volumes constitute contributions to the understanding of American race relations. And both are overpriced productions of the same publisher in the series of "Quantitative Studies in Social Relations" edited by Peter Rossi.

Beyond these similarities, however, these two books could not be more different. The first by Crain and Weisman is a free-wheeling, imaginative analysis of survey data in the empirical sociological tradition. The second is a restrained review of comparative black-white research of the late 1960s in the stodgy tradition of the *Psychological Bulletin.*

Discrimination, Personality, and Achievement reports an extensive analysis of a 1966 survey of black Americans conducted by the National Opinion Research Center for the U.S. Commission on Civil Rights. The Commission was interested in determining the effects of attending desegregated versus segregated schools. Hence, N.O.R.C. sampled 1,651 black men and women, aged 21 to 45, residing in 25 northern metropolitan areas. Middle-class black districts in the smaller metropolitan areas were oversampled so as to insure a sufficient number of alumni of interracial schools. The interview contained almost 500 questions and required an average of two hours. Many of the questions were utilized in another N.O.R.C. national survey that contained 1,326 white respondents; these data provide comparisons with those from the black respondents.

Crain and Weisman organize their analysis around the testing of a central theorem derived from both Abram Kardiner and Martin Luther King, Jr.: *Discrimination leads to psychological disability, which in turn prevents achievement.* Ideologically popular in the 1950s and early 1960s, and out of favor now, this theorem is relentlessly pursued in a lively, if sometimes exasperating, manner.

In general, the Kardiner-King theorem is supported by these cross-sectional and retrospective data; but the multivariate complexity of the issue also becomes clear. Consider several of the far-from-obvious findings: For the southern-born, what their parents told them about race appears to be more important for later achievement than whether they grew up in a broken home. For the northern-born, whether they attended interracial elementary schools appears to be more important (for achievement) than whether they grew up in a so-called "culturally deprived" home.

The original focus of the study on the effects of interracial schools also illustrates the complexity of this domain. The principal results are that interracial education is related to a

greater sense of security combined with some inhibition of aggression. These personality differences seem to explain why the black products of desegregated schools are much better educated, earn somewhat more money, and report being "happier." But the consistency of the racial experience in schools is also important. Elementary school desegregation does not relate to personality differences for those first raised in the South. And those associations with desegregated education that relate to interaction with whites (such as job information) are strongest at the high-school level.

The wide-ranging analysis touches on many thorny issues that have been subjected to considerable speculation. Coming from a broken home, for example, is related to lowered income for men and less educational attainment for women. Men from one-parent homes are more violently aggressive, feel less "happy," and possess less "internal control." These factors in turn relate to the respondent's own marital history. But Crain and Weisman also demonstrate that "homes broken by death are at least as damaging as those broken by separation" (p. 121).

Region of birth is another interesting variable. Black southern migrants possess lower self-esteem. But blacks born in northern ghettos seem to react to segregation by externalizing rather than internalizing their feelings and go "about in an unhappy rage" (p. xi). These personality distinctions then relate to achievement differences. And southern migrant men earn more money despite receiving less formal education.

Crain and Weisman close with an essay on the policy implications of their findings. They argue that housing desegregation has brighter prospects for being attained than school desegregation does. They even go so far as to call housing segregation "a house of cards," which, if it begins to collapse, "will fall of its own weight" (p. 187). Consequently, the authors recommend initiating desegregation efforts with new, expensive housing in the outer suburbs, followed by desegregating areas progressively closer in from these suburbs until the black housing need is met. Low-income white and black housing should be desegregated last.

This volume, then, provides some fascinating data, penetrating analyses, and thoughtful ideas. Its chief strength lies in its willingness to tackle explosive issues and reach currently unfashionable conclusions. "The new militancy," for example, is described as not "a prescription for change" but "merely a conservative defense of the attitudinal status quo . . ." (p. 152).

The book, however, could have benefited from considerable editing. The writing is often too casual to be persuasive. And those who insist on precision will be constantly annoyed by the many loose attributions of cause and the general neglect of the relevant race-relations literature. These same criticisms could be leveled against Crain's 1969 volume on *The Politics of School Desegregation*. Yet Crain conducts the studies and writes the books that the field needs. The irritating weaknesses of his style should not detract from the fact that these works are important contributions.

While Crain breaks new ground, Miller and Dreger have made careers of organizing comparative racial research from a psychological perspective. In 1960, they published a 42-page review of the field in the *Psychological Bulletin*. In 1968, they wrote a whole monograph supplement of the *Bulletin* that updated their review through 1965. Now this tome, published in 1973, covers the comparative literature from 1966 into 1970. As the field has rapidly expanded, the reviews have become increasingly lengthy, and this one has chapters by 19 authors.

The coverage is guided by a psychological view of what is important. While there are separate chapters on racial experimenter effects, language abilities, intellectual functioning, temperment, self-concept, social perceptions, and mental health, race and political behavior is relegated to one 25-page chapter. Among the 19 writers, 12 are in southern institutions, 11 are psychologists and psychiatrists, and only one is a political scientist.

The chapters are uneven and overlap considerably in places, as is typical of such contributed works. (Only one of the chapters, a behavior-genetic analysis by Jerry Hirsch, is a reprint.) Two of the nonpsychological chapters offer unusually effective and succinct summaries—Robert Malina's on biological substrata and Leonard Savitz's on black crime. Surprisingly, a number of seminal works from the 1966–1970 period go unmentioned in the relevant chapters (e.g., the 1967 U.S. Commission on Civil Rights Report, *Racial Isolation in the Public Schools*, in the chapter on the effects of desegregation).

There is little attempt to draw the diverse chapters together, and there are no summary or policy implications chapters. One interesting theme emerges, though, and divides the writers: Is there a separate black American culture with its own codes and speech? Joan

Baratz enthusiastically argues, "Yes," in writing on language; Jacquelyne Jackson answers, "No," in writing on family organization. Both could be correct if the ideological implications underlying the issue were defused.

The political chapter by James Clark reviews black political socialization and conventional political behavior. Clark also summarizes the research on unconventional political behavior, especially riot participation and its correlates. He then looks at racial reactions to violence, confidence in government, and black militancy. From his review, Clark derives a four-cell table of black orientations based on political efficacy and trust in the political system.

Comparative Studies of Blacks and Whites in the United States provides, then, an extensive overview of race research of the late 1960s. While it often reads like the *Encyclopedia Britannica,* the volume represents a useful initial place to check on the racial research literature.

THOMAS F. PETTIGREW
Harvard University

Biracial Politics: Conflict and Coalition in the Metropolitan South. By Chandler Davidson. (Baton Rouge, La.: Louisiana State University Press, 1972. Pp. 301. $11.95.)

This volume is a valuable, but disappointing, addition to a growing literature on black politics in the South. Davidson provides an excellent case study of racial politics in Houston in the 1960s. The disappointment arises from the less than convincing treatment given broad questions about the adequacy of the political process in providing socioeconomic justice for blacks and what strategy will best promote realization of this justice.

Houston is the largest, most rapidly growing city in the South and the same adjectives apply to Houston's black community. Since World War II the black population in Harris County, which includes Houston, has increased from 100,000 to nearly 450,000. During this period, the local black population has moved from virtual political impotency to playing a pivotal role in local politics.

The strength of Professor Davidson's study is his careful analysis of the social, organizational and electoral environment of Houston blacks in the midst of this transition. For example, the depressing impact on effective black participation of electoral contrivances like poll taxes, annual registration which closed for the year in January, at-large elections with a place system, and the unit rule in political party meetings are detailed. Davidson stresses the disparities in income, education, housing, and occupations that persisted in Houston after blacks entered the local political process. He concludes, "There does not seem to be any clearcut connection between the political pressures exerted by Negro interest groups, Negro politicians, and the Negro electorate on the one hand, and progress in obtaining benefits on the other" (p. 138). Even if blacks expand their gains at the ballot box, Professor Davidson questions whether this alone will make much difference in realizing a "just society" in which Negroes receive a "just share" of social and economic rewards. That realization, the author contends, will come only when blacks are able to exercise influence over the economic structure that distributes such unequal rewards to the racial populations.

Given this pessimistic assessment of existing black electoral prospects, how is racial justice to be secured? Davidson dismisses the alternatives of violent revolution and black separatism, urging instead the creation of "a biracial coalition . . . with economic goals radical enough to mobilize large sectors of the less affluent of both races" (p. 220). The author considers and rejects criticisms of this coalitional strategy, arguing that the class interests of blacks and have-not whites provide a suitable base to build a new political majority. Evidence supporting the plausibility of this progressive coalition is gleaned from a study of 20 Houston elections during the 1960s wherein it appears that low-income whites were more likely to vote for black-supported candidates than were middle- or upper-income whites. Some data from New Orleans and Atlanta were also included, but the tendency of low-income whites to back the same candidates as did blacks was less pronounced. Davidson attributes this difference to the noneconomic focus of elections in these cities as opposed to Houston. That being the case, he says the lesson for southern progressives is to define political issues in economic rather than social status terms so that "the ordinary southern white voter is effectively cross-pressured by appeals to his economic needs" (p. 219).

There are several problems with this argument about the ineffectiveness of current black electoral action and the likelihood that a new progressive coalition could remedy this situation. In the first place, Davidson's case study focuses on a narrow time slice—basically the mid 1960s—in the middle of a transitional era in Houston politics. The consequences of this narrow focus become evident when one notes

that almost all the electoral devices that Davidson describes as being used to reduce black political strength are no longer operative. In Houston and most other southern cities, it is much easier today for potential black electoral strength to be converted into effective political power than was the case in the 1960s. In Houston, New Orleans, and Atlanta, where blacks have been instrumental in electing mayors, this new political clout is reflected in substantive rewards like jobs at city hall. Urban blacks in the South have not yet gained a proportionate share of the rewards distributed through local political processes, but recent achievements have been significant.

The hazards of generalizing from a limited data base are evidenced by an examination of recent Houston elections. In the hard-fought mayoral contests of 1969, 1971 and 1973, for example, the candidates that were overwhelmingly backed by blacks drew their lowest support from low-income whites—a pattern at variance with what Davidson found earlier. Such results, coupled with similar patterns in contests like the Atlanta mayoral election in 1973, suggest to me the great difficulties confronting those seeking to create a stable electoral coalition of blacks and low-income whites.

Davidson might argue that the "real" issues of southern politics are class questions that cut across racial lines, but there is little empirical evidence that low-income whites in southern cities perceive issues in this fashion. Their perception of reality is more often one of conflict with blacks over housing and educational or job opportunities for they think it is their homes, their schools, their jobs that are threatened by the growing urban black populations. Without question, some interests shared by blacks and low-income whites lead them to support the same candidates on occasion (as in national contests where broad economic issues like employment policies are salient), but there remain persistent conflicts between low-income whites and blacks that continue to be reflected in other electoral contests. Current attempts to build permanent electoral coalitions in the South will almost certainly flounder on these conflicts.

In summary, Davidson has produced a first-rate case study of racial politics in Houston. In my opinion, however, he has understated the results and the meaning of black electoral participation and exaggerated the prospects for a stable, class based, coalition capable of substantially redistributing socioeconomic resources through the political process.

RICHARD MURRAY
University of Houston

Behind the Trail of Broken Treaties. By Vine Deloria, Jr. (New York: Delta, 1974. Pp xv, 263. $2.95.)

The States and Their Indian Citizens. By Theodore W. Taylor. (Washington, D.C.: United States Department of the Interior, Bureau of Indian Affairs, 1972. Pp. xxi, 307. $2.25.)

"Sometimes Indians are 'the hardest goddamned people on earth to help.' " (Taylor, p. 127.)

There is a crisis in Indian affairs, going far deeper than such recent "media events" as the "Trail of Broken Treaties" caravan to Washington, D.C. in 1972 and the confrontation at Wounded Knee in 1973. Deloria contends that this crisis is the inevitable result of flaws in American democratic theory and practice which deny to tribal peoples the political and cultural autonomy that treaty law supposedly guarantees to them. Collective, tribal interests are suppressed in favor of a concept of arbitrary, individual interest. Indians are thus forced to create a forum in which the tribe qua tribe can compel the attention of the American political system.

Deloria, a lawyer, argues that this need not be the case. Indian tribes are, or should be under treaty law, semi-autonomous and self-determining communities. Indian political rights as "nations" (tribes), he argues, were never extinguished through the treaty process, in spite of the fact that treaties often required signatory tribes to acknowledge the political sovereignty of the United States (p. 129). Federal court decisions emphasize that such stipulations " 'in no way divested the plaintiff tribe of its sovereign power to enter into treaties with the United States on equal terms. . . .' " (p. 138). This is the basis for "contract sovereignty" as guaranteed, defined, and delineated in treaty law. For Deloria it is the basis for a new federal relationship with the tribes.

The usual claim of "pragmatists" in Indian policy today is that it is too late to redress the grievances of the past. Indians are too few, too politically and economically impotent, too little endowed with the capacity for self-improvement. Deloria chooses to counter these arguments with a comparative study of the political, economic, and educational profiles of various independent and semi-independent states recognized internationally. The Navajo reservation is larger than a number of United Nations member states, including Denmark, Switzerland, Belgium, Israel, Lebanon, etc. And, although Indian population figures are small, particularly on a tribe-by-tribe basis, they still

compare with those of the smaller UN members, such as Qatar, the Maldives, Tonga, etc. pp. 166, 170).

The argument, of course, is that "contract sovereignty" is akin to "protectorate" status, which has "a long history of acceptance in international diplomatic practice, even though at times the states in question have had difficulty maintaining their independence" (p. 168). Such recognition would "clarify the status of Indian tribes and eliminate the inconsistencies that are presently found in the federal relationship with Indians" (p. 159). Deloria ends the book by outlining steps to accomplish this reworking of the federal principle, based on negotiation between the tribes and the federal government.

"The idealism in this idea," Deloria acknowledges, "is obvious" (Deloria, p. 260). So perhaps are some of the flaws. Legal arguments about Indian sovereignty are controversial; the international parallels shakey. The mysteries of independence and dependence often seem to defy rational analysis. Most serious is the absence of a thorough-going discussion of the dynamics of an American politics which would permit so drastic a re-structuring of political reality on behalf of Indians. Deloria raises far more questions than he answers. But they are provocative questions, reaching beyond the Indian case.

It is, of course, possible to deal with the Indian issue in a narrow sense, stressing unique legal and historical status in comparison with other minorities and political interests in the US. By drawing example and inspiration from a wider arena, however, Deloria draws attention to a universal problem of community rights. Particularly in democratic societies, the issue lies in the tension between the institutionalization of individual rights and the persistence of a demand for community rights. Two responses are possible here: first, to foreclose the issue by insisting on the inevitability of the disintegration of community interests in favor of individual ones; or, secondly, to broaden the issue by raising anew the classic questions of democratic theory about the roles of individuals and groups in democratic society. Taylor, to whom we now turn, chooses the former strategy.

The States and Their Indian Citizens is a response to the concept of the "new federalism," with its stress on the de-centralization of Federal authority to the States. This is a very different kind of "federalism" from that which Deloria proposes, and its consequences are dramatic for the Indian population, for whom federal ties symbolize their unique legal and historical status. Taylor is neither theoretical nor speculative, and his work does not lend itself to the same type of discussion as Deloria's work. It is, in fact, largely descriptive, giving information on the status and activities of Indian communities on a state-by-state basis. Particularly useful are the questionnaires submitted to 50 state governments and to some 245 chairmen of federally recognized Indian groups, and the compilation of their responses (cf., Taylor, Appendices L and M). The absence of explicit theory, however, only underlines that which is implicit.

Taylor's book suffers from a number of serious problems, not least of which is the author's largely uncritical reflection of the Bureau of Indian Affairs' attitude toward Indian policy, which in turn represents a predisposition in American society to assume the inevitable disappearance of communal interests. It is only in light of this assumption that Taylor can defend the argument that government-sponsored policies of enforced acculturation were ultimately in the best interests of the Indians, and that "permissive acculturation" was simply impossible in the absence of a "conducive environment" (p. 15). This is far too critical an issue to be glossed over so casually. Why and how in "pluralistic" American society did there come to be no alternatives? Why wasn't the environment conducive?

A major shortcoming of this book is its failure to examine the tensions among the states, the federal government, and the various Indian tribes. This is crucial. Indians have traditionally viewed the attempts to extend state jurisdiction into "Indian country" (such as Public Law 280 and House Concurrent Resolution 108) as a threat to their special legal status, and have resisted strongly. To ignore this context is to miss the significance of the whole question of the state role in Indian affairs.

Another problem is the author's unwillingness to take seriously the legal—and perhaps also moral—claims of Indian tribes on American society. While disparaging the claims of "professional" Indians to legal redress (p. 125), he urges them on to pursue individual "self-sufficiency." Are there not, in Taylor's sense, "professional" Southerners, corporate businessmen, labor leaders, etc.? Are their claims invalidated? And why the unquestioned primacy of individualism over collective interests and rights?

Taylor is not unsympathetic to the Indian case, but is rather often insensitive to its legal and theoretical ramifications, especially in the area of individual versus collective rights and the problem of the tyranny of the majority.

This brings up the second possible response to the issues Deloria raises, the theoretical one. Federalism is essentially an administrative concept, referring to relations among governmental units. Rights, on the other hand, are pre-eminently vested in the individual in Anglo-American democratic theory. The Indian tribe falls between these two stools. Under the present system, the recognition of the tribe as a political entity must grow out of one of two statuses: first, as an assimilated, solely governmental unit (cf., the Indian Reorganization Act of 1934); secondly, as the mere aggregate of individual interests of citizens who happen to be Indians (cf., the Indian Bill of Rights of 1968). The tribe-qua-tribe disappears in both these contexts, for it is more than a unidimensional political unit and certainly more than the mere aggregate of individual interests.

The issue here is ultimately the status of the community, the collective rather than aggregated individual interest, in democratic societies where competitive individual interest has been the foundation of policy. The "discovery" of the individual as the basis of all political and social authority was one of the crowning achievements of early modern political theory in Europe. The consequent rejection of absolutist collective authority, whether vested in church or state, was inevitable.

It is important to note two things, however. First, the pre-eminence of communal responsibilities and interests over individual rights does not necessarily lead to tyranny, particularly within a tribal, rather than state political structure. Secondly, the persistence of group loyalties, broadly conceived, undermines the traditional assumption of classical democratic theory that groups acting as expressions of individual interest function only where the direct expression of those interests is curtailed. Clearly re-examination of the role in democratic society, not merely of tribal groups, but of "groups" as a general category, is needed.

In avoiding clear-cut statements about the political status of communities and of groups based on race, religion, ethnicity, class or whatever, democratic theorists have tended to imply that competitive individual self-interest in the economic—and political—marketplace is the only basis for democratic societies. Self-interest is assumed to underlie any and all "group" memberships, its shifting nature precluding permanent groups and alliances in the "open" society. This is clearly a serious underestimation at best of the ways in which community and group membership may channel and direct the expression of individual interest. It also fails to allow for the enforced permanence of racial, ethnic, and religious groups bound together by discrimination, where individuality may not be recognized. More important, however, is the failure to explore the nature of the community, the collective interest group, more thoroughly.

The discussion of the tribe is really an exploration of broader dimensions of the idea of the group. The tribal community is more than a unidimensional religious, political or social status. Rather, it encompasses all of these and more. Not merely a mechanical aggregate of its parts—built of political or religious or social allegiances alone—the tribal community is more than the sum, irreducible. It is, in a way, the arbiter of what the individual can be and thus of what his interests are, rather than vice versa. On this idea of collective interest democratic theory is largely silent.

The issue of possible reconciliation of these two concepts of vested rights, individual and collective, stands as a challenge to contemporary political theory. American policy has, in the Indian case, traditionally chosen to resolve through abolition of the Indian system the ambiguities of the issue. Deloria has suggested that one alternative to this is to look to the international arena for solution to a dilemma which is not unique to this society. Taylor chooses to reflect the argument that the special status and claims of the Indian communities are merely historical anomaly, and that the substitution of state for federal jurisdiction merely confirms the trends assumed in democratic theory.

In these positions both the "Indianist" and the theorist have fuel for argument. The tribal community as a living institution, rather than an anthropological artifact, is little known to political scientists. Exploring various aspects of tribalism may prove very fruitful to social science and to all those concerned with the fate of democratic societies.

Labyrinths of Democracy: Adaptations, Linkages, Representation, and Policies in Urban Politics. By Heinz Eulau and Kenneth Prewitt. (Indianapolis, Ind.: Bobbs Merrill, 1973. Pp. xxxi, 713. $15.00, cloth; $9.00, paper.)

Labyrinths of Democracy, the master report of a comparative study of eighty-two city councils in the San Francisco Bay region, is a very important book. Yet it is a book whose importance is not likely to be quickly understood.

First of all, it was consciously written as a group-level study. This meant that the authors had to be aware at all times of whether they were aggregating individual properties, whether they were making statements about the integral properties of the groups themselves, or whether they were relating the groups to the still more inclusive contexts in which they were situated. Further, since *Labyrinths* stands almost alone as a group-level analysis, the authors were forced to devise many operational indicators—for example, a stratification index, an index of interaction, a measure of role differentiation, and so on—for the concepts they used. This pioneering effort should lead to other group level studies. Yet it has been more than two decades since Herbert Simon reminded us that "complexity in any body of phenomena has generally led to the construction of specialized theories, each dealing with the phenomena at a particular level," and if we are just beginning systematic theorizing at the group level, one cannot be very optimistic about how rapidly our colleagues will pick up this lead.

Second, this study is very tightly integrated. No review can do more than suggest the richness contained in the 700+ pages, 30 chapters, and some 226 figures and tables, but concepts are linked together in chapters, chapters are linked together in sections, and the sections are linked together in the "adaptations, linkages, representations, and policies" sequence of the subtitle. In the section showing how the group adapts to its environment, for instance, five forms of social relations, opinion leadership, cosponsorship, opposition potential, friendship, and expertise, are related to each other, to stratification, and to the external and internal complexity of the council. In the following chapter, six governing practices, general exchange, limited exchange, bargaining, compromise, coalition formation, and ministration, are similarly analyzed and then related to the forms of social relations. In succeeding chapters, there are equally detailed accounts of social climate, patterns of interaction, and role orientation. All of this leads up to three decision structures, unipolar, bipolar, and nonpolar, which are in turn related to three models called conflict, permissiveness, and fragmentation. The flavor of this tight analysis may be suggested by almost any summary quotation, as this from p. 206:

> The effect of *stratification* (on decision structure) is ambiguous. In the larger cities, high *stratification* makes for *conflict* and *constraint* in the *decisional structure,* while in the small cities it makes for *harmony* and *permissiveness. Social climate* has a more consistent effect. In both large and small cities, an *antagonistic climate* makes for *conflict* and *fragmentation* but favors *constraint.* The *political governing style* is conducive to *fragmentation, conflict,* and *constraint* in the large but not in the small cities. *Politicized interaction* makes for *conflict* and, to a lesser extent, *constraint* in the larger cities but for *fragmentation* and *conflict* in the smaller cities. *Role differentiation* favors *harmony* and *permissiveness* and, to a very limited extent, *integration* in the larger cities but makes for *fragmentation, permissiveness,* and *conflict* in the smaller cities. (Emphasis added.)

Each of the words I have emphasized in this quotation are concepts to which Professors Eulau and Prewitt have given specific denotations and for which they have devised measures. (Moreover, this section is followed by others dealing in turn with council ties to the electorate and interest groups, with the quality of representation, and the resulting public policies.) This is a most impressive analysis, but it is not the type of reading for one's nightstand nor the light phrasing that enlivens conversations.

Finally, *Labyrinths* cuts across the specializations into which political science is divided. Since it presents a view of how community policy is formulated, it could be seen as a contribution to urban politics. Since it is concerned with questions of linkage and representation, it certainly fits into legislative politics. Since it carefully compares processes across governmental units, it has something to say to comparative politics. Since it is an example of how theorizing is an integral part of the research process, it should be consulted by theorists. Yet I suspect that *Labyrinths* will be seen ultimately as illuminating that oldest subject matter, governance. And on this, it is well to close with the authors' words (p. 611): "Even if it were possible to identify all the relevant variables, and even if our tools of inquiry were perfect, democratic governance would [still] prove elusive as a topic of investigation. The more we know and the more reliably we know it, the more complex will democratic governance appear to be."

From Contraband to Freedman: Federal Policy Toward Southern Blacks, 1861–1865. By Louis S. Gerteis. (Westport, Conn.: Greenwood Press, 1973. Pp. 255. $11.50.)

One experience unique to black Americans has been a basic change in their place in the

body politic. White Americans rebelled in 1775 to preserve ancient liberties as Englishmen. Red Americans still battle to maintain tribal autonomies. Black Americans ceased to be chattels during the Civil War and since then have been trying to better themselves from a fundamentally changed legal position in the society.

Louis Gerteis, in an important book, examines with discernment the federal government's role in an early stage of that development, the transition from contraband to freedman. In doing so, he calls into question just how basic the change of emancipation was. This process took place under the chaotic conditions of civil war during which: "The decisions made . . . shaped postwar policies toward the freedman and in large measure precluded the possibility of radical social reconstruction in the South" (p. 7).

The northern army proved more zealous than the southern in exerting its power to enforce law and order upon unfamiliar Negroes. (The Confederates, by and large, depended on their women-folk and the slaves, themselves, to maintain stability while concentrating on the unsuccessful fight against Yankee invaders.) Union soldiers herded black refugees into displaced persons' camps where they were forced to work in field gangs growing crops in the camps. Other blacks were required to contract to work for carpetbagger planters in the Mississippi Valley or local planters in the occupied sections of Louisiana. The contracts provided that rations be supplied and wages paid. Often the required wages were omitted, and the army aided the planters by enforcing the work provisions of the contracts. Gerteis contends that the union officers "had no theories about plantation operations which differed from those held by [southern] planters" (p. 94).

Gerteis does not think the stage of transition from contraband to freedman held any promise of basic social change for those who had recently been slaves. They were still held captive in a plantation system. He dismisses the Port Royal experiment on the sea islands, where former slaves became independent farmers, as an irrelevant exception; and he insists that the black communal farming experiment at Davis Bend, Mississippi—despite a profit of $159,200 in 1865—pointed to no useful future because it was so closely controlled by army officers committed to the gang labor methods of the plantations system. Professor Gerteis is a careful scholar, and it cannot be denied that his sober reappraisal of the period corrects some excessively optimistic views held a short time ago by historians eager to see in Reconstruction bright signals for total success in the Civ Rights Movement. Nevertheless, in dismissin some of the more hopeful experiments i building a better life for the freedmen whic carried over into Reconstruction, he does nc see that an experiment can have value despit limited immediate success. Even hopes that ar dashed are important.

Gerteis discounts the usefulness of norther allies and omits local white southerners (scala wags) who accepted the changed place o black southerners. And, by focusing on fed eral policy, he sells the freedmen themselve a bit short. He fails to recognize, for example the dominant reason why army officer Thomas Conway, who had been a defender of the labor camps, became, as a Freedmen's Bureau offi cial, an advocate of the distribution of land to black farmers: It was pressure put on him by black constituents. The Southern freedmen came out of slavery with generations of experience of dealing with the plantation system and planters. They knew what they did not want—work in a field gang—and what they did—an independent farm. Gerteis shows us that obstacles to the achievement of independence were raised everywhere, and yet the freedmen were not merely victims. They struggled; and the struggles, remembered by later generations, made the transition from contraband to freedman an important time. Since then, in just over one hundred years, black Americans have made gains within a hostile society at a rate that is perhaps unprecedented in the history of once-enslaved peoples.

Government Competition in the Electric Utility Industry: A Theoretical and Empirical Study. By Richard Hellman. (New York: Praeger Publishers, 1972. Pp. 500. $25.00.)

Regulation by independent administrative agency has come under increasing attack by political scientists, economists, lawyers and practitioners. At the same time, greater attention is being directed toward possible avenues for changing the basis for government involvement in the public utility industries. It is particularly appropriate, therefore, that Richard Hellman's study should appear at this time.

Professor Hellman argues that there are three principal options for industry organization and social control in the public utility field. These are (1) publicly-owned monopoly, (2) privately-owned monopoly operating under

government regulation, and (3) government competition. Hellman believes that government competition is clearly the outstanding choice if one wants to promote the public interest. He notes that "government competition may . . . be defined in terms of two criteria: First, as a new displacement, threatened or actual, of an existing utility company; and second, as any threatened lowering of rates" (p. 48).

According to Hellman, the most important contribution of government competition lies in the area of dynamic pricing and promotion of service which, in turn, enhances the public welfare by assuring that more service will be available at lower rates. He argues that such an objective cannot be adequately achieved by recourse to publicly owned monopolies or to regulated private monopolies. Traditional regulation is viewed as static and passive, and incapable of motivating acceptable corporate behavior. Interestingly, Hellman welcomes "competitive interaction" between both private and publicly owned electric utilities, so that the motivation for superior performance may come from either a public or a privately owned utility seeking to outperform the other.

Hellman seeks to place the development of government competition in the electric utility industry in historical perspective, and elements of his argument are supported by history. For example, TVA provides an excellent illustration of successful government participation in the electric power field. On balance, if one accepts most of Hellman's arguments regarding the past benefits of government competition, three major questions still remain to be analyzed. Unfortunately, they receive little or no attention from Hellman, but they must be considered an integral part of any proposal that government competition be adopted as a substitute for commission regulation in the future.

First, the process of introducing competition or rivalry into the public utility field can give rise to unique problems of price discrimination and cross-subsidization. Unless the threat of potential competition is prevalent in all markets served by an established utility, the firm will tend to employ earnings from monopoly markets to facilitate underpricing or limit-entry pricing in potentially competitive markets. This practice will be facilitated by the high proportion of overhead costs which characterize these industries. Experience has shown that both private and public enterprises (e.g., the Bell System and the U. S. Postal Service) will employ such pricing strategies when confronted by selective competitive pressures. The results will have an adverse effect on the improved performance which Hellman seeks.

Second, experience indicates that competition in the public utility industries is not necessarily self-reinforcing. In part, public enterprises appear to lose their zest to compete over time (as demonstrated by Hellman's discussion of the New York Power Authority after 1950). But this diminution of competitive vigor also stems from the fact that both private and public firms, once established in their respective spheres of influence, may simply choose to coexist rather than incur the risk associated with continued competition.

Third, according to Hellman, competition leads to progressively lower prices and aggressive promotional practices. At present many environmentalists discourage the use of electricity and promote conservation. Neither public nor privately owned utilities have been inclined to innovate in this area of rate design, and it would be valuable to have Hellman's assessment of the contribution of competition under such circumstances.

Despite the claims made for government competition in electricity, there still appears to be a major role for some form of regulation or social control by an appropriate government agency. The need to establish pricing guidelines, the need to maintain industry flexibility, and the need to recognize national priorities all point to such involvement. Professor Hellman has demonstrated that the process of regulatory reform must not overlook the contribution that could be made by government enterprises operating in a competitive fashion as a constraint on corporate power and as an inducement to superior performance.

The Politics of Electoral College Reform. By Lawrence D. Longley and Alan G. Braun. (New Haven, Conn.: Yale University Press, 1972. Pp. 222. $2.95, paper.)

The recent presidential election makes timely this concise but thorough examination of the perennial issue of the electoral college and what, if anything, should be done about it. Professors Longley and Braun conclude that nothing less than direct popular voting for president will satisfy their specified criteria of democracy, legitimacy, and effectiveness of the winner, and invigoration of politics through the two-party system.

After a foreword by Senator Birch Bayh, whose electoral reform efforts are applauded

elsewhere in the book, Longley and Braun review the origins and history of the electoral college. They give special attention to 1960, when the closeness of the race threatened to produce an electoral vote at odds with the popular vote, and 1968, when it seemed quite possible that the Wallace third party campaign would result in neither major party candidate's receiving an initial electoral vote majority and would therefore bring on a season of bargaining either among the electors or in the House of Representatives. The mischievous possibilities of slates of unpledged electors, such as appeared in 1960, and "faithless electors," who appeared in both 1960 and 1968, are pointed out, plus the usual "what might have been" analyses of changes in the outcomes that would have resulted from slight popular vote shifts in certain states.

In a somewhat mechanistic way, the authors review the features of the various reform possibilities: the automatic plan (elimination of the electors with the state electoral votes registered directly), the proportional plan (split of each state's electoral votes according to its popular votes), the district plan (separate choice of electors in each congressional district), direct and nationally pooled popular voting, and several hybrids. A separate chapter argues in detail for direct national popular voting, with a provision for run-off between the two top candidates if neither gets over 40 per cent of the total vote. The run-off feature is felt to be necessary in order to produce a winner with a recognized mandate.

In their historical material and general approach, Longley and Braun follow the pathway marked out several years ago by Neil Peirce in *The People's President*. Their arguments for the direct vote are buttressed by tables, largely derived from the work of John F. Banzhaf III, showing deviations in the respective states from the per state average of voting power of citizen voters under the electoral college and the various reform plans. These calculations are supplemented by special work for this study by John H. Yunker showing state deviations from the national average voting power per citizen voter. These data illustrate the advantaged position of large-state voters produced under the present system of casting each state's electoral votes as a unit, which of course would not be changed under the automatic plan. They also show the advantages that would go to small-state voters under the district or proportional plans. There are further analyses of the effects of the present and various reform systems on regions, urban, suburban, and rural residents, and foreign stock, black, and blue-collar voters.

In arguing for the direct popular vote, the authors note and dispose of the principal arguments that have been used against it. The idea that the states, as such, have a significant stake in presidential voting is brushed aside. It is pointed out that direct voting would insulate against election fraud and maladministration by eliminating the temptation to try to swing large blocs of electoral votes by tinkering with a few returns in closely contested big states. Competition would be enhanced by the incentive for all parties to get out their maximum vote in all states. Finally, and most crucially, the authors reject the argument that the direct vote may undermine the two-party system by attracting a multiplicity of candidates. They point out that it would take a remarkably strong third-party candidacy—much stronger than Wallace's in 1968, for example—plus a very close contest between the major party candidates to force a run-off. They have faith that the 40 per cent plurality and the indivisible nature of the presidency itself will protect us against a proliferation of minor parties.

The book's most original contribution is a detailed narrative and analysis of the strong, but ultimately unsuccessful, drive for electoral college reform in the 91st Congress. In 1969, with the memory of the Wallace threat still fresh, a resolution for a constitutional amendment providing for the direct popular vote passed the House of Representatives. On the Senate side, however, it took a year and a half of maneuvering—complicated by the Haynsworth and Carswell nomination fights which swirled around the same committee—for the reformers led by Senator Bayh to beat off the other plans and get a direct vote resolution to the floor. By now it was late in 1970, and a classic filibuster ensued. Southern Democrats with conservative Republican support held out successfully through a month's debate and two attempts at cloture. If a two-thirds vote for cloture could not be mustered, it was doubtful that the two-thirds necessary to pass a constitutional amendment could be secured either.

In its strong advocacy of the direct vote, this book differs from the recent comparable study for the Brookings Institution by the late Wallace Sayre and Judith Parris, who traversed much of the same ground and concluded that the uncertain hazards of change outweighed the visible advantages. Pay your money and take your choice.

LAURIN L. HENRY
University of Virginia

The Citizens' Council: Organized Resistance to the Second Reconstruction: 1954–1964. By Neil R. McMillen. (Urbana: University of Illinois Press, 1971. Pp. 397. $10.95.)

This book is a history of the southern White Citizens' Councils and of the efforts of the Councils and related groups to resist racial integration during, essentially, the decade immediately following the *Brown* decision of 1954. In considerable detail, Professor McMillen describes the Councils' origin and their expansion throughout the South, and he notes the varying degrees of influence they attained in their attempt to resist desegregation. His description of Council activities emphasizes that diversity characterized the movement in general, even within states. He attributes this diversity to the cultural heterogeneity increasingly characteristic of the southern region. The author concludes that ethnological factors primarily influenced the pattern of white southern resistance to desegregation, but he suggests that other factors were also important in shaping the racial attitudes of particular southern communities. He finds that the quality of state and local political leadership "profoundly affected" popular responses to desegregation. As the Councils' inability to prevent the advance of integration became apparent, the movement began to decline—a trend that began not long after the Little Rock incident. By 1961, he concludes, "It had all but disappeared in the peripheral states, and in the Deep South, where its power and prestige had always been greatest, the movement was demoralized and in disarray" (p. 362). Following the enactment of the Civil Rights Act of 1964, the organization focused its attention mainly on the private school movement.

The author devotes two chapters to the content of Council thought. At the outset, he notes that the Council movement failed to develop "a systematic intellectual framework in which to operate" (p. 159). Council attitudes varied from region to region in the same manner as the movement's growth and influence, and because of this "intra-organization heterogeneity" were often contradictory and incongruous. Nevertheless, McMillen finds that there were some general beliefs with which the entire movement could agree. Fundamentally, he says, Council ideology was founded on the notions of racial segregation and white supremacy. Council doctrine thus reflected a basically racist point of view. White Citizens' Councils are frequently linked with other ultra conservative groups, and McMillen finds many similarities between Council ideology and that of other right-wing organizations. He sees the Councils' overriding concern with race, however, as a distinguishing characteristic of Council ideology. Indeed, "Council thought was essentially monistic. Racial difference was the ultimate reality before which all other issues paled in significance" (p. 204). McMillen also sees the Councils' official policy of following "strictly legal" methods of defiance as a feature that distinguished them from the more extremist of the southern resistance groups. He concludes, in fact, that "whatever may have been the theoretical relationship between the explosive atmosphere [the Council organization] so often created and the actual outbreak of violence, there is no tangible evidence which suggests that it engaged in, or even overtly encouraged, criminal acts" (p. 360). In a chapter on "the politics of racial integrity," McMillen describes the Councils' efforts to gain political power and points up their characteristically varying roles in the political life of southern states. He also describes the Councils' excursions into national politics, where their activity mainly took the form of efforts to influence the outcome of presidential elections through involvement in independent elector and third-party movements.

As the book's title indicates, McMillen has not attempted a history of the organized southern resistance movement in its entirety. He has focused his study on the activities of the Citizens' Councils, and his efforts have produced a carefully drawn, comprehensive history of the Council movement. Much has been written about the Citizens' Councils, and their more prominent characteristics are well known. McMillen's contribution lies in his approach to his subject: he supplies the detailed information that is necessarily lacking in less complete treatments of the Councils. The book is written in a forthright, lively style; it is well documented and includes a bibliographical essay. As McMillen makes clear, the Citizens' Councils, although always a minority, exerted a strong influence for a time on the racial policies of southern states, especially those in the Deep South. His history of the Councils should be of interest to those desiring information about this facet of race relations in the recent South.

JAMES D. THOMAS
The University of Alabama

The Budgeting and Evaluation of Federal Recreation Programs, or Money Doesn't Grow on Trees. By Jeanne Nienaber and Aaron Wildavsky. (New York: Basic Books, 1973. Pp. 172. $8.95.)

Time has not been kind to PPB, the planning-programming-budgeting system promulgated for the United States Government by President Johnson on August 25, 1965. A decade later, few signs remain of the innovation that once stirred the world of budgeting. The formal structures of PPB were quietly dismantled some years ago, and now even the term provokes disdain.

While PPB still was alive, Professors Jeanne Nienaber and Aaron Wildavsky set out to study its operation in two federal agencies—the National Park Service and the Forest Service. (They also took a limited look at the Bureau of Outdoor Recreation.) The bulk of their investigations were conducted during 1969, at a time that PPB already was moribund in some agencies but before its formal termination in 1971. The authors made no attempt to bring their story up to date, so that when it was published late in 1973, the situation already was different from that described in their book.

Nienaber and Wildavsky have produced four sets of essays, only loosely connected to one another: (1) Why organizations can't evaluate, (2) how traditional budgeting is done, (3) how PPB wasn't done, and (4) paying for recreation. These themes are prefaced by a brief discussion of the criteria used to appraise the application of PPB in the study agencies. The authors acknowledge that since there are no "accepted criteria" for gauging success or failure and no way of specifying "proper outcomes," they therefore are impelled to examine the "processes through which the decisions leading to these outcomes are made" (p. x). The book thus suffers from the affliction attending most discussions of PPB. The authors' own perspectives and preferences take command. What should be a straightforward empirical account of budget practices in several federal agencies turns instead into still another polemic contra reform. As a consequence, PPB remains almost as unstudied today as it was a decade ago.

This nonempirical cast appears in the first essay, "Evaluation as an Organization Problem," an insightful and lively consideration of why self-evaluating organizations rarely exist. This essay comes at the start of the book; it is not at all informed by the discussion of budget practices in later chapters. Yet it is the most valuable part of the book (though it has also appeared in substantially the same form as an article in the *Public Administration Review*), for it explains why organizations both covet and fail to do much self evaluation. The basic message of Nienaber/Wildavsky "is that evaluation and organization are to some extent contradictory terms" (p. 3), a thesis which is forcefully presented by portraying the probable fate of "evaluative man" in an organization. As an outsider, the evaluator always is at risk of losing either his independence or his influence. He cannot have it both ways: serving his organization loyally and yet steering it away from its traditional course. The organization wants commitment; evaluative man gives it skepticism. The evaluator puts deeds and goals to the stern test of public good; the organization relates instead to clienteles and self interests. The organization strives for stability, evaluation impels it to change.

Despite these intractable difficulties, Nienaber and Wildavsky value the evaluative ethic. Like the ancients, they too seek to join knowledge and power. They suggest that the political role of evaluation be recognized and that politics and evaluation "be joined together so that each becomes part of the other" (p. 35).

The authors next turn to traditional line-item budget practices in the National Park Service and Forest Service. They concentrate on the preparation of estimates by field units, with attention to the forms used for the submission of requests. But they fail to penetrate to the bowels of the study organizations, to examine how the budget is put together piece by piece, or how conflicts and pressures are handled in the field or in Washington. The authors view agency budgeting primarily as a matter of maintaining existing facilities, though they also refer to the inevitable tensions between maintenance and expansion strategies.

Throughout the discussion, Nienaber and Wildavsky take it for granted that the agencies were operating under extremely tight budgets, with no money for new programs, and perhaps not even enough to properly maintain existing facilities. These budget realities seem to have colored the entire budget preparation process, driving out planning and analysis. It is unfortunate that some 100 pages after these constraints were reported, the authors challenge them in a back-of-the-book footnote, pointing to the high growth rates experienced by the two agencies.

The third section of the book consists of two chapters on program budgeting. The authors confess that it is "exceedingly difficult to appraise the PPB system in terms of its utility or its decision-making value" (p. 89). Nevertheless, they offer a tentative conclusion which

is much more favorable to PPB than is usually found in Wildavsky's writings: traditional budgeting is most appropriate for routine activities such as maintenance; PPB-type processes might be most appropriate for planning and development purposes. They also acknowledge that "an important function of the PPB system thus is, in practice, its ability to generate data that support agency or departmental goals and objectives."

Having tendered this favorable statement, the authors in the next chapter return to a more conventional view of PPB, focusing on the program structure used in the Department of Agriculture and on difficulties of integrating PPB with the routines of traditional budgeting. Nienaber and Wildavsky conclude this discussion with an erroneous statement: "Students of administrative irony may note that PPBS was abolished in the context of a circular that dealt largely with simplification of paper work" (p. 142). PPB suffered many indignities, but its demise was announced in a memorandum dealing with agency budget submissions for the next fiscal year.

The final portions of the book are wholly divorced from the preceding sections. Nienaber and Wildavsky assess who should pay for recreation benefits and how the recreation programs of the federal government should be financed. They carefully balance environmental and developmental interests and offer some sensible suggestions for increasing the federal investment in recreation facilities.

The book is better in its parts than in the whole. Not closely linked together, the parts should be of interest to persons studying evaluation, budgeting, or recreation.

ALLEN SCHICK
Congressional Research Service

Cable Television U.S.A. By Martin H. Seiden. (New York: Praeger Publishers, 1972. Pp. 272. $16.50.)

The Invisible Resource. By Harvey J. Levin. (Baltimore, Md.: The Johns Hopkins Press, 1971. Pp. 432. $12.00.)

These two books are both rewarding and frustrating reading for students of public policy toward broadcasting. They are rewarding because they provide careful, detailed descriptions of the regulatory policies of the F.C.C., one in the limited field of cable television regulation, the other in the whole area of spectrum allocation as it affects various radio and television uses as well as more specialized uses. They are frustrating because they are studies of the policies themselves and the consequences which flow from the policies, with little or no attention given to the procsses by which these policies are shaped. But each makes substantial criticisms of the F.C.C.'s policies as they stand, criticisms which if accepted would entail a fairly comprehensive alteration in the policies of the Commission.

Seiden's book, an outgrowth of his dissertation at Columbia University, reviews the regulation of cable television through the 1972 revised rules. It contains a wealth of data not available elsewhere on cable television penetration and its regulation. It also presents a very useful review of the various court cases which have shaped both the authority of the F.C.C. and the policies it has pursued. For these strengths alone the book is a very welcome addition to the literature.

The central argument of the book is that the F.C.C. has seriously hampered the growth of the cable television industry by the erection of formidable regulatory barriers to the economic viability of cable television firms. These barriers, Seiden argues, reflect the fears of the most powerful broadcasting interests, most notably networks, stations, and station groups, fears about the likely inroads a thriving cable industry might make into their own profitability. Seiden minimizes the bases for such fears. He further points out that these same interests have themselves made sizable investments in the fledgling cable industry, an industry which is bound to remain financially dwarfed by the networks and stations, even if released from regulatory bondage.

Because the advent of a "wired nation" would result in a greater variety and flexibility of broadcast services, Seiden bemoans the "mind-boggling complexity" of F.C.C. cable rules. He suggests that such regulation as is necessary could better be done by local governments which in his view are better placed to adopt rules suited to their needs.

The F.C.C. is also the bogeyman of Levin's study of the allocation of spectrum space to all broadcast uses, though the implications of Levin's study, if accepted, are far more profound. An economist, Levin has examined the interplay between competition and regulation in spectrum allocation. He advocates the introduction of a modified free market for spectrum space. Because the F.C.C. through license grants and through the arbitrary reservation of certain portions of the spectrum for particular uses—AM, FM, and land-mobile radio; VHF, UHF, and educational television

—has prevented the maximum utilization of scarce and valuable spectrum space, the marginal value of the broadcast-and-common-carrier spectrum to next-best users has risen steadily, he argues.

He points out that the licensing-allocation function of the Commission confers sizable franchise value without at all guaranteeing diversification of program choices, healthy competition and the technological innovations that would result, and maximum local services, goals to which the F.C.C. has given consistent lip service.

Despite the convincing case each author makes for his criticisms of F.C.C. policies, neither gives attention to the processes by which these policies have been made. Therefore, each has written a traditional study of public policy by comparing governmental outputs against some putative rational model—a model which ignores the dilemmas of public policy makers enmeshed in a power system that constrains their choices.

Nonetheless, each author has assembled very useful data for students of public policy, and each book will stand for some time as the authoritative treatment of its specialized subject.

FRANK WOLF
Drew University

History of U.S. Political Parties. Edited by Arthur M. Schlesinger, Jr. Vol. I: 1789–1860, From Factions to Parties. Vol. II: 1860–1910, The Gilded Age of Politics; Vol. III: 1910–1945, From Square Deal to New Deal; Vol. IV: 1945–1972, The Politics of Change. (New York: Chelsea House Publishers in association with R. R. Bowker Co., 1973. Pp. 3544. $135.00 for the set.)

This massive and costly collection of essays and documents about American politics was written and edited by historians for historians. Political scientists will be able, with some effort, to pick some tasty raisins here and there from the veritable ocean of cereal, and the packaging may make the goodies a bit easier to find than by the usual rummaging through libraries' card catalogues and stacks. But scholars interested in parties *as institutions* will find the collection of little utility.

Schlesinger's package is mislabeled. It is called "History of U.S. Political Parties," but its contents touch only one segment of that vast subject. Its materials are concerned with *national* politics only, and its 3544 pages contain hardly a word on state and local politics and parties. Moreover, even at the national level it deals only with *presidential* politics: there is almost nothing on the history of the parties in Congress or in the national committees. Even the powerful Congressional Caucus of the period 1796–1824 is barely mentioned.

In addition, the presidential parties are conceptualized, discussed, and documented strictly as arenas for conflict among individuals and factions seeking nominations and control of platforms, never as actual or potential performers of electoral and governing functions. Hence the essays on the various parties and historical periods concentrate mainly on the rise and fall of contenders for nominations and add an occasional bit about platform struggles. The documentary materials following each essay include letters and speeches of party leaders, resolutions by state legislatures, party manifestoes and platforms, newspaper reports and editorials, magazine articles, and some of the proceedings of national conventions. One looks in vain for such materials on the *institutional* development of parties as the calls for and rules governing the national conventions, the resolutions establishing the first national committees in 1848 and 1854, debates over the unit rule, two-thirds rule, and bonus votes, and texts of the early presidential primary laws. Indeed, the only such materials in the entire collection are the 1971 reports of the McGovern-Fraser and O'Hara commissions.

Accordingly, the reader who wants to know what many people prominent in presidential politics from the 1790s to now have said about issues and about each other will find this collection useful. But the reader who wants to know how American national parties have become what they are today will still have to depend on the documentary materials in libraries and on the analyses of Ostrogorski, Ford, Schattschneider, Hofstadter, Key, Epstein, and others whose names and ideas are absent from these particular eleven inches of Professor Schlesinger's extensive personal shelf.

Merger Politics: Local Government in Tidewater Virginia. By David G. Temple. (Charlottesville, Va.: Published for the Institute of Government by The University Press of Virginia, 1972. Pp. xv, 225. $12.00.)

During the two decades following World War II the most frequently proposed solution for the metropolitan problem was the consolidation or merger of small, fragmented governments into a single, viable, area-wide

unit. Although widely suggested, only in Virginia did this proposal enjoy any degree of success. There, four mergers or consolidations were achieved between 1957 and 1963; one represented the merger of two cities, and three involved city-county consolidation. This study examines the events associated with these four mergers.

Professor Temple focuses on the various steps and stages in the process of merging these units of local government. Within this framework, he examines the conditions and events which motivated the consolidation movements and the environmental context at the time, describes what took place at each of the political and legal stages of the procedure, and indicates the major changes that occurred in the local governmental structures and procedures following consolidation. His data sources were the relevant legal documents, official and unofficial documents of the former governments and study groups, newspaper accounts, and interviews of available significant actors in each of the cases.

Why were these mergers successful? Temple concludes that the two cities were combined because of a fear that political control in one would soon be in the hands of blacks and that such an outcome would be detrimental to certain interests in both cities. In three instances of city-county consolidation, the immediate concern was impending annexation of urban county areas by an adjacent city. Under the Virginia practice of city-county separation, annexation removes the area and its residents and improvements from county jurisdiction and makes them a part of the annexing city. Behind these immediate reasons, however, was the desire of certain interests to maintain as much of the political status quo as possible. Under a consolidated city government these interests could no longer be annexed by an "enemy" city and would have a continued opportunity to pursue and influence desired goals in the new, if enlarged, unit of government.

Temple views these mergers as basically political actions, but clearly the political interests of oligarchies dominated. The movements for merger were initiated by a self-selected few, the bargaining and negotiations over the governmental structures to be included in the new city charter extended only to incumbent office holders, and the securing of the requisite legislative approvals were carried out by and confined to the same self-selected few, usually incumbent, elected officials. Only in the campaigns for the merger referendum were the general citizenry really participants, and even here the leaders followed tried and true political campaign tactics—claims of dire consequences if merger were not successful, and paternalistic assurances that the leaders had the best interests of the area at heart. This strategy worked, for each referendum was approved by a substantial margin.

Temple presents an interesting case study of a rather unusual happening in American local government. His major interest is in the events associated with each step of the merger procedure, and the study is a good general tour through the difficulties encountered at each of the stages from initiation to termination. As he notes, however, a particular combination of time, events, conditions, and effective leadership made these mergers somewhat unique—a conclusion reinforced by the subsequent failure of five other attempts at city-county consolidation in Virginia. Temple's study preceded these failures, but a comparison might lead to a clearer understanding of the critical variables involved in local government mergers.

CHESTER W. BAIN

Black Politics: A Theoretical and Structural Analysis. By Hanes Walton, Jr. (Philadelphia, Pa.: J. B. Lippincott Co., 1972. Pp. 246. $7.95, cloth; $4.95, paper.)

This book apparently has two major purposes. It is designed to "explore black politics north and south from the colonial period to the present day" and "to set forth some theoretical insights and generalization about black political maneuvering and manifestations in this country" (pp. xvi–xvii). While the latter task is not fulfilled, the book has merit in that it does carry out the former goal.

In the book's first chapter, Professor Walton correctly charges that studies of black politics have had two major deficiencies. First, they have examined black electoral behavior to the exclusion of other forms of political activity. Second, the studies have concentrated upon the numerous differences between the electoral behavior of northern or southern blacks, giving little attention to the similarities. To correct these deficiencies, Walton offers a new conceptual framework to guide research in the area.

His framework consists of: (1) four stages which are distinguished by different levels of black political activity, (2) events, such as the 1965 Civil Rights Bill, which move blacks across the states, and (3) the decision-making process which determines the content of the

events. The framework essentially posits that blacks can exhibit four levels of political activity and that the actual level blacks in a particular locality achieve is a function of the type of events produced by the local political environment.

As the author desires, the framework forces researchers to view black electoral behavior as only one facet of black political behavior and to give attention to the commonalities between the political experiences of blacks. The framework presents at least as many problems as it adequately addresses, however. For example, when Walton distinguishes between his stages, he treats levels of black political activity as absolutes. This procedure seems analytically naive. Blacks are a particular racial subgroup in the American political arena affected by the same pressures—though perhaps by some additional ones—toward participation or passivity as other subgroups. Thus to make a valid assessment of black political activity levels, we should consider these levels relative to those of other subgroups. Furthermore, Walton offers the readers little insight about the events in the larger political arena which could cause changes in black political activity levels.

Most of the merit of this work lies in the book's succeeding eleven chapters in which Walton presents a wealth of information about the nature of black participation in American politics from the colonial era to the present. He describes the roles blacks have played in electoral politics, machine politics, party politics, pressure-group politics, presidential politics, public office, and as citizens of urban centers. Although the narrative is uneven and sometimes confusing in these chapters, much of the information has never before been provided in book form.

The book is additionally useful to the scholar in this area because of its extensive bibliography citing literature on black politics, conveniently listed according to subject matter.

CAROLYN SUE WILLIAMS
Xavier University

The Politics of Progress. By Raymond E. Wolfinger. (Englewood Cliffs, N.J.: Prentice-Hall, 1974. Pp. 416. $10.95.)

Long-awaited by readers of Robert A. Dahl's *Who Governs?*, Raymond Wolfinger's dissertation research now finally published under the same title promised in a Dahl footnote but substantially revised in light of controversies sparked by the earlier, seminal work, is must reading for those who remain concerned about power and democracy in urban, industrial societies, if only because these data help place Dahl's own analysis in a more complete empirical context. Indeed, the subsequent pluralist/neo-elitist debate, by clarifying and narrowing the issues, has made the subject matter of Wolfinger's study all the more central.

For one thing, the study focuses on the one issue area which all sides have conceded was critically important to New Haven's future: the redevelopment of the city's central business district. Second, within the urban renewal policy arena, Dahl's own, highly abbreviated discussion leaves open the possibility of conflicting interpretations not easily resolved without adducing further information. We are now fortunate to have available nearly two hundred pages of detailed information on Mayor Richard Lee and his urban renewal program (as compared to less than fifty in Dahl's study) to assist the reader in drawing his own conclusions. Third, in the course of providing details on policy formation, Professor Wolfinger tells us a good deal, if not quite enough, about whose homes and businesses were condemned for redevelopment, the specific uses to which the redevelopment tracts were put, and various relocation practices. In short, any instructor who still finds (as I do) that Dahl's study of New Haven is a valuable introduction to urban politics owes it to his class discussions to peruse this volume with care.

Wolfinger himself denies that his study is "part of the 'community power' genre," though he admits that "it does contain a good deal of evidence relevant to propositions that have been developed in that literature" (p. 9). Instead he states that the volume is designed to serve two other purposes: (1) "to explain how important innovative policies were conceived and executed in New Haven" and (2) "to use findings about New Haven to test and revise prevailing theories about local politics" (p. 1). In pursuit of the second purpose, Wolfinger discusses in two splendid chapters the continuing significance of ethnic and machine politics. Indeed, Wolfinger departs significantly from Dahl in his much greater appreciation of the significance of the machine-style character of New Haven's Democratic organization. He demonstrates quite convincingly that machine politicians are quite indifferent to policy questions as long as their control over patronage is not disturbed, that popular mayors can use their prestige and control over material incentives to centralize power, but also that activist, modernizing urban programs can at times

:opardize the interests of (and therefore ıayoral relationships to) traditional party or-;anizations. Wolfinger's discussion of these ubjects is focused, intelligent, and nicely :ocumented.

As valuable as are many of the discussions ɔn these and other worthy topics, the heart of he study revolves around Wolfinger's attempt o "explain how important innovative policies vere conceived and executed in New Haven" (p. 1). Successful pursuit of this objective requires that it be directly connected to his second purpose of testing theories about local politics; only if an explanation is theoretically grounded can it be generalized beyond the particulars of Mayor Lee's New Haven regime. In this regard, Wolfinger's central argument is that "in New Haven the mayor played the leading role in policy formation. . . . More than anything else, urban renewal policy resulted from his ambitions, not those of private groups" (p. 12). Although in an important respect discussed below, Wolfinger's contention is certainly correct, this explanation, by itself, is not theoretically satisfying. As Wolfinger himself points out in his closing chapter, heroic leadership appears only infrequently and erratically on the local political scene. What then is there about these circumstances which can be generalized to urban politics as a whole? What are the conditions that permitted Lee's leadership in New Haven's redevelopment and not elsewhere?

The answers to these questions implicit in Wolfinger's analysis suggest the direction that pluralist theory has taken in the decade since *Who Governs?* For Dahl, it was critical to show that power was widely shared among the various social, ethnic and racial groups in the city. Wolfinger makes no effort to identify socially diverse sources of influence on policy formation; on the contrary, only a small number of businessmen and developers are taken into the confidence of Mayor Lee and his top administrative staff. But Wolfinger does not conclude from these findings that a ruling elite has come to power; he emphasizes instead the fortuitous nature of many of the events that he describes. The redevelopment of the central business district was begun because a Gamble store happened to fold; it gained key support because the National Bank needed a larger, more modern structure; determined opposition came from a jeweler whose new store had to be demolished; and it finally succeeded because Yale University fortunately funded a developer unable to raise cash elsewhere. Given the multiplicity of forces that accidentally shaped even important policies, no ruling elite can be detected.

Along with this emphasis on complexity, one finds a tendency to disaggregate and decompose all units of analysis to the level of the individual. In Dahl's analysis, political and social groups help form the context for political action; Wolfinger, sharply distinguishing himself from group theorists, disaggregates much further, finding it difficult even to speak of the interests of central-business-district businessmen. In commenting on an important issue in the pluralist/neo-elitist debate, for example, Wolfinger notes that developer Stevens influenced policy but lost money, while Malley's department-store executives had little influence over project design but in the end made money on redevelopment. By disaggregating to the individual, Wolfinger tries to show that manipulators of power need not coincide with its beneficiaries.

Such an interpretation has its appeal, especially when the details are described with as much vigor and felicity as in this study. The difficulty is the atheoretical quality of such an enterprise. As Andrew MacFarland has observed, if pluralism simply means multiple causality, reciprocal influences, and continually changing processes, then its contribution to political theory has sharp limits. Analysis tends to degenerate into description, and the facts that must be included in a coherent account grow almost endlessly. As with post-Wagnerian romantic music, the ambiguity, modification, and subtleties of nuance are so manifold, the score is so thick, as it were, that the demand for a new simplifying structure grows irresistible.

Given his individualist orientation, it is somewhat surprising that Wolfinger does not borrow more extensively from the political economy literature in his analysis of the problems of collective action in New Haven. Had he done so, he might have interpreted Mayor Lee less as a Superstar who cajoled and compelled others to follow his lead and more as a brilliant political entrepreneur who enticed others to give to a common cause. Much of the case that redevelopment was *not* a businessman's plot rests on the grounds that Lee had to make extraordinary efforts to induce individual businessmen to contribute to his urban renewal drive. But as Olson and other economists have demonstrated, a policy can be in the collective interest of businessmen and still lack the support of individual businessmen, all of whom may wish to "free ride" on

the efforts of others. Recently, Frolich et al. have noted that leaders can provide collective goods by convincing individuals that their efforts will be matched by others. From this perspective, Lee seems to have been a very successful leader who helped central-district businessmen achieve a collective outcome of benefit to most of them. It takes nothing away from Mayor Lee's skills as a political entrepreneur to note that he chose to put his energies to the service of such a cause rather than, say, behind a massive low-income housing program for New Haven's *poor*. To make such an observation, however, requires that one find categories other than the "individuals" analytically appropriate.

In its details, the study, even for post-Watergate readers, is ruthlessly honest about the "warts" of the American political system; Mayor Lee had good political reasons for objecting to its publication as long as he remained in office. As with the special prosecutor's office, however, the book has mired itself in facts at the cost of understanding the significance of the events under investigation.

PAUL E. PETERSON
The University of Chicago

Java in a Time of Revolution. Occupation and Resistance, 1944–1946. By Benedict R. O'G. Anderson. (Ithaca, N.Y.: Cornell University Press, 1972. Pp. xv, 494. $15.00.)

It is not easy to do justice to a book of such excellence as this in a short review. Professor Anderson has given us a superb piece of historical reconstruction of the first ten months of Indonesia's "revolution," or struggle for independence, in 1945–46, sketching out the various social and political forces at work with a sharpness of perception that will probably never be bettered by a foreigner. At the same time, he has forced us to look at Indonesian politics from a new and highly revealing angle, challenging many of the assumptions that have previously been made about the political processes at work there.

His major contribution has been to revise what might be called "the Sjahrir version" of the Indonesian revolution by rehabilitating the reputation of Sutan Sjahrir's great rival, Tan Malakka, showing the significance of his role and actions against a strikingly different backdrop. Most previous writers have followed G. McT. Kahin's pioneering account of those events, *Nationalism and Revolution in Indonesia* (Ithaca, N.Y.: Cornell University Press, 1952) in which the political parties, with Sjahrir's Socialist Party bulking much larger among them than its later history seems to warrant, were seen as emanations of a great upsurge of mass political consciousness, their ideological doctrines reflecting the views of the major groupings within Indonesian society. Anderson shows us in devastating detail that the parties were in fact "little more than clusters of small personal cliques . . . None . . . had as yet any organized base among the masses, even in the urban areas" (p. 230). The party politics of Indonesia's first year of struggle for independence could virtually be depicted, he says, in terms of the maneuvering of five key cliques, none notably stronger than the others, against a background of debate over the merits of conducting the struggle by strategy of *diplomasi* (negotiations — seeking to exert pressure on the Dutch through the British and Americans) or *perdjuangan*, armed conflict. But more important, he argues, were the rise of the army, of the many irregular *"strijdorganisaties"* and of the *pemuda* (youth) movement with its distinctive *"pemuda* consciousness" moulded by the social upheaval accompanying the collapses of Dutch authority.

One of Anderson's central arguments and assumptions is that if Tan Malakka and the advocates of *perdjuangan* had prevailed in their internal struggle for power with the Sjahrir-Sukarno group of exponents of *diplomasi*, the course of Indonesian history would have been radically different. Because the latter policy was directed towards gaining international support and recognition it was incompatible with a radical social program. "From this came the deepening malaise of the post-independence years, and later tragedies" (p. 407). In a significant aside (p. 408), Anderson suggests that if Sukarno had thrown his weight behind Tan Malakka and the strategy of *perdjuangan*, Indonesian history might have followed a quite different course, perhaps more comparable with that taken under Ho Chi Minh's leadership by the Viet Minh. This is an intriguing and important hypothesis, but not, I think, a fully persuasive one.

Anderson's whole approach to the events of this period rests, in fact, on the assumption that a more militantly revolutionary strategy such as the DRV's would have worked—i.e., it would have been successful in mobilizing the masses against Dutch colonial rule and would have proved victorious sooner or later in forc-

ing the Dutch to abandon their hold there, even if it took a much longer and more bloody struggle to achieve it, as in Vietnam. This hypothesis undoubtedly deserves consideration, for it has perhaps been brushed aside too quickly by previous writers. Conceivably Tan Malakka's strategy would have been just as successful — and it might have been better for the country's sociopolitical health in the long run. It is interesting to note that General Nasution, whose ideological presuppositions are very different from Anderson's, shares the view that Indonesia's leaders made a serious mistake in not pressing the resort to armed struggle and seizing weapons by force from the Japanese immediately after they surrendered. He may be right. Possibly such a course of action would have deterred the British from reoccupying Java and Sumatra and thus forestalled the Dutch come-back in 1946–47, which would have entailed a very different course of events. But I doubt it. Because the strategic and political situation in Java in 1945–46 was so very different from that in Vietnam, it would have been highly improbable that a campaign based solely on armed struggle and a spurning of negotiations with the Dutch and British could have been maintained for long. (Even Ho Chi Minh felt he had to negotiate with the French in 1946, before he was driven to conclude that war was unavoidable.) If Tan Malakka and Sukarno could have worked together along the lines advocated by the former, they would have found themselves forced by circumstances into much the same sort of hot-and-cold mixture of *perdjuangan* and *diplomasi,* requiring compromises with the Dutch, that the Sukarno-Hatta-Sjahrir governments pursued, with ultimate success in 1949. Moreover, if we assume that a guerrilla conflict might have held the colonial forces at bay into the 1950s, as in Vietnam, we are thrust into a realm of speculation about what attitude the USA would have taken after the outbreak of the Korea War towards a left-wing national liberation movement in Indonesia. If instead of opposing the Dutch, the U.S. had then supported them, as it did the French, would the Indonesians have won their independence? It is hard to imagine. I suspect they were lucky to get it when they did, for their success in exploiting international pressures on the Dutch in 1948–49 would not have been nearly so easy to achieve after 1950. That is not the end of the argument, of course. And inconclusive though the debate will remain, Anderson has put us in his debt by challenging us to reconsider so much of the conventional wisdom about that fascinating piece of history.

J. A. C. MACKIE
Monash University, Australia

Israel and The Palestinians. Edited by Shlomo Avineri. (New York: St. Martin's Press, 1971. Pp. 168. $10.00.)

Crushed between the anvil of Jewish nationalism and the hammer of Pan-Arabism, the proud people of Palestine have an unhappy lot, and their problem can hardly be ignored by any book which purports to be a comprehensive study of the fast-moving events in the Middle East. Remarkably, this collection of essays, written after the bloody Jordanian Civil War in 1971, contains not one independent essay on either the PLO, its leader Arafat, or its radical splinter groups which are the most dynamic and powerful Palestinian political and military structures. Thus, even though it was written between 1969 and 1971 this book is already obsolete.

Among its redeeming qualities, however, is that it was written mostly by Israelis and that several of them, like Moshe Dayan, former defense minister, and two retired generals and Arabists, Harkabi and Peled, have addressed themselves to the Palestinian problem. In fact, most of the essays are translations from articles in the Israeli papers, especially *Maariv,* where the debate over Palestine and the Palestinians began as soon as the ceasefire was signed on June 10, 1967. The selections in the book are but a few taken from a multitude of articles written by Israelis of all persuasions, occupations, and roles about the future of Palestine and the Palestinians. In fact, one could speak of Israeli Palestinian ideology as a literature which seriously competes with the Palestinian studies curriculum in Beirut (connected with The American University) as the center of Palestinian activism, and of their scribological and ideological writings. The major thesis of the Israeli Palestinian ideology is put forth by both Professors Avineri and Shamir. Avineri discusses Israel's reluctant but "inconvenient realization that the Palestinian Arabs are a political force that, whatever its ultimate military weakness and the terroristic nature of much of its activity, has to be taken seriously" (p. 14), and that not since 1948 has there been a public discussion in Israel about the Palestinians comparable to what is now going on (p. 15). The essays demonstrate that pub-

lic leaders like Moshe Dayan are sensitive to the issue. Arie Eliav, for example, the former secretary general of the Israeli Labor Party also called for accepting the claim of the Palestinians for a political identity of their own.

But the issue being debated is no longer whether there is a Palestinian consciousness or a Palestinian political identity. The critical issue now is who should rule the Palestinians: the Hashemites, the "moderates" (those who accept a West Bank-Gaza solution), the notables, the clients of Israeli administration, or the maximalists led by the PLO and Arafat and their radical splinter groups. Of the authors, only Professor (retired general) Yehoshafat Harkabi addresses this question. Harkabi argues that it is neither the moderates nor the notables who determine political and regime orientations for the Palestinians. Rather, he says, their rejection of Israel is a deeply felt ideological one. Harkabi writes, "In the presence of the Palestinians' intention to annihilate us we cannot promise ourselves to become soft, and at times cannot even assume a humanistic stance, and this is a self-contradiction" (p. 6). Harkabi's antagonist, Professor Shamir, former head of Shiloah Middle Eastern Center at the University of Tel-Aviv, calls Harkabi's thesis on Arab intransigence a myth. Shamir argues that in the post-Six-Day-War period, new Arab approaches emerged, as the Arabs saw that trying to destroy Israel was futile. He says the Arabs hoped to put an end to the struggle by utilizing the opportunities created after the war, salvaging Palestinian society by improving Palestinian living conditions and "obtaining a reasonable minimum of national goals" (p. 25). Thus Shamir challenges Harkabi saying that "by concentrating only on the literature published in the Arab states, he [Harkabi] diverts attention away from the no less significant development among the West Bank-Palestinians and ignores what could have become the cornerstone of a promising new Israeli approach to the problem of peace" (p. 29).

The PLO and the Arab states answered Shamir at the Rabat Conference that met in November 1974. There the PLO, not the West Bank Palestinians, was recognized as the political group speaking for the Palestinians. Shamir's pipe dream of a West Bank-Israeli sponsored Palestinian state had few voices supporting it in 1971 and none in 1975. Thus the debate became futile and the issue obsolete.

The PLO, although it represents less than 25 per cent of a population of 2.3 million i the Palestinians' most powerful political anc military group. With the help of the "Arat Rejection Front" those who wanted no part o: Kissinger's mediation, Syria, Algeria and Libya set the tone in Rabat for recognizing the Palestinian entity. They made a case for the establishment of a secular "democratic" Arat Palestine. It would be an Arafat state dominated by Suni Arabs and made up of Palestine, Israel, and ultimately Jordan.

Unfortunately, Harkabi's thesis turned out to be correct. His vindication was not due to foresight but to the Arab mood in the period after the 1973 war. As yet no Israeli intellectual has found the proper formula for the Palestinians, nor would Avineri and Shamir accept the Arafat solution. The PLO not only does not recognize Israel but its term "secular democratic state" is a euphemism for the annihilation of Israel. No Israeli cabinet, however reasonable, can accept an Arafat-dominated Palestine. Nor will the Hashemite Kingdom accept Arafat and the PLO's independent state unless imposed by their Arab brethren. Since Israel has no intention of bringing about its own destruction and the PLO has not abandoned its grandiose plan for the United Suni Arab-dominated Palestine, the tragic plight of the Palestinians is no closer to solution than it was in 1948. The PLO, not Israel, must change its formula. Otherwise, the Palestinians, a proud, politically conscious people, will remain stateless. An all-or-nothing formula is no cornerstone for new Israel-Palestinian relations.

AMOS PERLMUTTER
The American University

Peasant Society in Konku: A Study of Right and Left Subcastes in South India. By Brenda E. F. Beck. (Vancouver: University of British Columbia Press, 1972. Pp. xx, 334. $16.50.)

It is perhaps unusual that a book which has little to do with politics specifically should be reviewed in the *APSR*, but then this is a remarkable book. It is a masterly job of social science detective work and an exemplary form of anthropological inquiry. The task Professor Beck sets for herself is to examine the interrelationship of the social and territorial organization of various castes in the Konku region of South India, an area corresponding roughly to modern Coimbatore District of Tamil Nadu. Following the residents' own con-

ception of local social structure, Beck analyzes the social organization of Koṅku in terms of five nesting, territorial units; the region as a whole, the subregion, the village revenue unit, the hamlet, and the individual household. What emerges is a clear picture of a bifurcated prestige structure characterized by rivalry between groups basing their claims on the control of territory and of the local labor force (those castes traditionally identified as of the "right," a term of dichotomous distinction with no value implications as such) and those which base their claims on the acquisition of material wealth, self-acclaimed ritual superiority, and, more recently, education (those of the "left").

At each level of social organization, the two blocs are distinguished by differences in customs and traditions, but at the lower levels of the caste hierarchy, these differences decline as a result of the commanding influence of the land-owning dominant caste of the right division, the Gounders (transliterated as KavuNTars), over the economically dependent lower castes of the left division. Beck argues that "the ability to control agricultural production is the key factor in understanding KavuNTar dominance, and their exclusive power position is the key to the development of the extensive social oppositions observed" (p. 268). She concludes that "only where landed, political power and ritual purity — the two major routes to status in Hindu India — remain largely separate, can a right-left division . . . be expected to develop fully. In the classical Indian worldview, material wealth by itself is inadequate as a third, parallel route to prestige. Unless it is combined with one or both of the other status criteria, it cannot contribute to social superiority over more than the lowest-ranking groups. Thus people who possess material wealth but who have been traditionally excluded from land ownership tend to develop an interest in ritual purity in order to offset the inferior power of their riches" (p. 267).

The system of transliteration employed is cumbersome and often requires real effort to recognize what might otherwise be a familiar Tamil name. Perhaps the best example is that of the dominant caste of the Koṅku region. Usually written as "Gounder," it is here transliterated KavuNTar, without identifying the term with the more ordinary usage. Moreover, the index includes Tamil names only in this scheme of transliteration — rendering it difficult to use. Nadar becomes NāTār; Siva (the god), Civā; Chola (the kingdom), Cōra; etc. But this is a minor irritant in an otherwise superb study.

ROBERT L. HARDGRAVE, JR.
University of Texas at Austin

Research on the Bureaucracy of Pakistan. By Ralph Braibanti. (Durham, N.C.: Duke University Press, 1966) Pp. xxiii, 569. Price not listed.)

Ralph Braibanti's major work concerning the study of the Pakistani bureaucracy was completed in 1965 and published in 1966. It is unfortunate that it has taken more than ten years for a review of its contents to appear in the pages of this journal because *Research on the Bureaucracy of Pakistan* is one of the more noteworthy displays of scholarly writing on Pakistan. Indeed, it stands among the finer volumes produced by American South Asianists. As the title implies, this is more than a general narrative and analysis of administrative development in Pakistan. Professor Braibanti is a meticulous scholar with an extraordinary interest in detail. He has succeeded in putting together a reference book which is must reading for anyone doing research in Pakistan's administrative history, organization, function, and developmental problems. The author has carefully included in this elaborate bibliographic essay virtually all the significant and many of the obscure works bearing on the subject up to the time of the book's publication. It is to be hoped that Professor Braibanti will consider the possibility of doing a second volume on the subject so that the material released during the period 1965–1976 can be brought to the attention of academic and government researchers the world over. Under the leadership of Zulfikar Ali Bhutto, the Pakistan government has instituted sweeping administrative reforms and the changing bureaucratic system could use Braibanti's perceptive examination.

This book is divided into six substantive chapters with a seventh reserved for the author's general observations. It also includes a lengthy set of appendices which is somewhat rare today, in this era of high-cost printing. There are also a number of tables scattered throughout the book which are especially helpful in grouping some of the basic parameters of Pakistan's administrative government. Braibanti traces the historic development of the bureaucratic apparatus in Pakistan, but he is

more concerned with identifying, classifying, and evaluating the public records published during 1947–1965. It is the author's contention that the study of government and political processes in Pakistan must lead to an examination of the bureaucratic system and its operations. Braibanti was among the few Americans of the period to view Pakistan as an *administrative state* in which politicians or "popular" representatives were actually subordinate to the higher career bureaucrats. The author served as an advisor to Pakistan's Civil Service Academy, the elite training institution for probationers entering the privileged services before 1973. Moreover, his tour of duty began in the midst of a period of martial law which was to last forty-four months. He was also on the scene to witness the re-emergence of the political parties and ultimately the drafting and promulgation of the Ayubian constitution of 1962.

In spite of all the references to a democratic political system it was clear to Professor Braibanti that the bureaucracy would be more not less prominent in the new presidential system detailed by the 1962 constitution. The system of rural and local government known as basic democracies was reinforced by this constitution, and here too the bureaucracy was given a preeminent role. On the one hand, Professor Braibanti is impressed with the efficiency as well as ability of Pakistan's bureaucratic elite. He certainly sees its role as vital in the maturation of the country's economic and political institutions. On the other hand, he is convinced that sophisticated political processes come with time, experience, education and overall human and environmental change. Professor Braibanti suggests it is for these reasons that Pakistanis were resigned to the fact of bureaucratic dominance in the country's earlier stages of growth. And it is this general condition which permitted the bureaucrats to perpetuate their self-serving superiority myth. But Braibanti is also quick to comment on the instability of bureaucracy during periods of increasing popular awareness. One cannot fault the author for not predicting the tragedy that was to befall Pakistan in 1971, but a careful reading of the chapters on the history and organization of the bureaucracy, local government, and administrative reform, carry hints of the disaster that eventually overwhelmed the country.

Professor Braibanti's fascination with legal systems and particularly the one that the Pakistanis inherited from their British overseers is obvious throughout the book. Chapter Five, which concentrates on legal research, reveals inextricable linkages between the legal and bureaucratic systems. Professor Braibanti helps us to understand why in Pakistan the legal system protected the bureaucrats and seldom the politicians or parliamentarians. Nevertheless, the author is strengthened in his belief that the bureaucracy's power is constrained by statutes, legal custom, and tradition. In general, the administrators were expected to assist the country in its democratic quest. One can only speculate about the author's impressions concerning events after 1965 — especially the concerted attack on the higher bureaucracy in the later stage of the Ayub decade, throughout the Yaya Khan interregnum, and finally up to the time Zulfikar Ali Bhutto announced that the country would no longer tolerate a privileged, elite class of bureaucrats and ordered their dissolution. The amalgamation of the services, the disbanding of the long dominant Civil Service of Pakistan (CSP), the virtual politicization of the administrators have their antecedents, and the sources are to be found in this volume.

As noted at the outset, this is not just another narrative on the Pakistan condition. Professor Braibanti's book is unique because it represents a thorough examination of available research materials on the subject of bureaucracy in Pakistan. As such it will always be an important instrument for students of Pakistan's government.

LAWRENCE ZIRING
Western Michigan University

Irish Unionism 1: The Anglo-Irish and the New Ireland, 1885 to 1922. By Patrick Buckland. (New York: Barnes and Noble, 1972. Pp. 363. $16.25.)

Irish Unionism 2: Ulster Unionism and the Origins of Northern Ireland, 1886 to 1922. By Patrick Buckland. (New York: Barnes and Noble, 1973. Pp. 207. $11.50.)

It is said that the events of centuries ago are still fresh memories in Northern Ireland. Perhaps there, more than anywhere, the past still lives in the present. But is it a real or an imaginary past? Until recently it was largely an imaginary past. In fact, in both northern and southern Ireland particular versions of Irish history have been used as weapons in intercommunal conflict. History as ideology is always a dangerous thing because it perverts the culture and deters serious scholars, who fear to tamper with popular myths. But in recent

years Irish history has been undergoing a major revision. Robert Kee's *The Green Flag* (New York: Delacorte, 1972), for example, is a model of sensitive revisionism, and one should also mention two courageous books by ministers in the present (December 1975) Irish government, *States of Ireland* by Conor Cruise O'Brien (New York: Pantheon, 1972) and *Towards a New Ireland* by Garrett FitzGerald (London: C. Knight, 1972). One important reason for the new revisionism has been the latest phase in the continuing tragedy of sectarian conflict in Northern Ireland beginning in 1968. So divisive, and apparently insoluble, has this conflict become that serious attempts are being made to clear away the historical shibboleths of both Protestants and Catholics to determine if there exist clues in the past which will help Ireland out of its despair. Emerging from this review is a more balanced account of Ireland during the years of English conquest and occupation, together with a challenge to the romantic revolutionary tradition and the cult of the gunman. There is also a willingness to question the value of the 1916 Easter Rising and the War of Independence. More important, however, for our purpose, is a growing understanding among the Catholic, nationalist Irish in the Irish Republic that there exists, in Northern Ireland, a Protestant Irish nation, or at the very least a subculture, which can no more be coerced into a Dublin parliament today than it could in 1914.

Patrick Buckland is not a revisionist in the sense of one who consciously seeks to reinterpret the past with a view to illuminating the present. Only toward the end of Volume Two does he seriously consider the importance of the past for the present. These two volumes are for the most part descriptive rather than interpretive, but they do present valuable information which can only confirm the revisionist view of the Irish Protestants. Indeed, Buckland writes about not one but two Irish Protestant communities. The first, the Southern Unionists, represented the Ascendancy—Anglo-Irish landlords, elitists, Anglicans, paternalists, a genuine upper class. Because they were scattered throughout the south and represented a small minority overall, their vulnerability obstructed an Irish settlement prior to 1917. But they were the first to realize that home rule was inevitable. They came to fear desertion by both the British government and the Ulster Unionists and therefore moved, in 1917, to protect their property and their status in an Irish parliament. Most of Volume One deals with this *rapprochement*, beginning with the Irish Convention of 1917–1918. They failed, ultimately, and were extinguished as a political force in southern Ireland.

In the north, however, the Protestant majority had a very different character. It represented every social class, from the Belfast laborer to the landed aristocracy. Indeed, the support of the urban working class helps to explain the tradition of sectarian violence, street battles and shipyard brawls, associated with the northern Unionists. Furthermore, the northern Protestants contained a majority of conservative Presbyterians, descendants of the so-called Scotch-Irish, and the historical memories of the whole of Ulster included the Battle of the Boyne and the defeat of the Catholic James II. As Catholic nationalism prospered in the nineteenth century Ulster Unionists did not seek accommodation but retreated into a siege mentality. They were determined to protect their religion, property, status and the union with Britain by resort to civil war, if necessary. This was no idle boast, as Buckland makes clear, although many nationalists still refuse to believe the Unionists meant war. Unionism represented much more than Orange bigotry. If Volume One explains, in part, at least, why a united Ireland was impossible before 1914, Volume Two makes absolutely clear why it has been impossible ever since. What Protestant resistance in the north finally earned was not the maintenance of the union but the creation of a new, six-county, Northern Ireland where the pattern of sectarian hostility was institutionalized as Protestant supremacy. Furthermore, if ever there was any hope of Catholics and Protestants making a new start in the new state, it was surely destroyed by the inauspicious early years which were set amidst the civil war in the south. It was during those years that the Protestant government of Northern Ireland, feeling itself besieged by Catholic, revolutionary nationalism, introduced the despotic Special Powers Act and the infamous "B Specials." Not until Britain belatedly took Northern Ireland under direct rule fifty years later were the Protestants to surrender those powers.

The story of these two Protestant communities is extremely important, but Buckland at times reduced it to a rather parochial and even pedestrian level. This may be because he writes from the Protestant perspective, and his most original contribution is in his use of Protestant papers and documents. The views of the Irish nationalists and the British government are de-

liberately neglected. He does not pretend to present the Irish Question as a whole. A political scientist seeking explanations in history for a contemporary dilemma will find these books incomplete. Furthermore, Buckland might well have shortened his study by cutting some of the detail on the internecine conflicts of the Southern Unionists and combining the two volumes into one. However, these are reliable sources. They do present the perspectives of the two unionist communities in Ireland in a manner which is well researched and generally well documented. They are, therefore, important for those who believe, with this reviewer, that any solution to the Irish problem must begin with a clear understanding of the critically important evolution of Protestant Unionism in the years from 1885 to 1922.

A Study of Chinese Communes, 1965. By Shahid Javed Burki. (Cambridge, Massachusetts: East Asian Research Center, Harvard University Press, 1969. Pp. 101. $6.00.)

Ten years after the data were collected, and six years after publication, Shahid Javed Burki's slim booklet *A Study of Chinese Communes, 1965* remains a beacon in modern Chinese studies for two reasons. First, it is one of the best collections on rural China at one point in time, 1965. It does not contain extensive data; but it stands out as a small oasis in the desert of ignorance about rural China in the 1960s. Second, Burki's book demonstrates that it is possible to collect significant information in China in the context of a guided tour. It should be examined by scholars who plan to travel to China, to assist in developing a research methodology.

Mr. Burki was a member of a three-man delegation from Pakistan which traveled in China in Summer 1965 for a six-week study of communes. The delegates interviewed officials in Peking, but these reports are not particularly helpful, because it is often difficult to know the precise material included. For example, does Table 1, Use of Mechanized Equipment in Chinese Agriculture, 1957–1964 (p. 5) include mechanical equipment used for irrigation? Although Burki implies it does, other figures suggest that mechanical pumping equipment alone has more horsepower available than the aggregate shown in this table.

The strength of Burki's booklet is the systematic collection from thirteen communes of micro-data on technical transformation, collective income and expenses, wages, etc. Virtually no other source has as much information on the private plots, which Burki discovers provide 10 to 30 per cent of family income on roughly 5 to 10 per cent of the cultivated land. Burki might have pointed out that the high productivity of the private sector does not indicate inefficiency of collective farming; land used for vegetables and animal raising always produces much higher cash income per unit area than land used for grains. The importance of the private sector to family income is, however, vividly demonstrated. In general Burki shows China's agriculture to be gradually modernizing.

One wishes Burki had "massaged" his data a bit more and looked for more relations between education and research, technical transformation, and income growth. While the sample is too small for any conclusive statistical analysis, more hypotheses could have been generated on the sources of agricultural growth.

Scholars traveling to China may wish to borrow Burki's methodology. It consists of having a narrow focus, but probing deeply. If Burki's group visited the Great Wall, the museums, schools and factories, such visits were kept to a minimum. At the communes, they asked questions in a vocabulary and in categories which were well understood by the cadres. They systematically collected information on the same questions at many communes, so we can begin to specify the diversity of experiences in China and perhaps see the vague outline of the distribution of various experiences. If other visitors to China have the opportunity to do this sort of focused, systematic analysis, our understanding of China can continue to grow.

The Strategy and Structure of British Enterprise. By Derek Channon. (Boston, Mass.: Graduate School of Business Administration, Harvard University, 1973. Pp. xvii, 257. $12.00.)

This is a revised version of the author's prize-winning dissertation submitted to the Harvard Business School in 1970–71. It is one part (thus far, the only published part) of a coordinated research project directed by Bruce Scott to study the evolution of industrial enterprise in five countries: France, Germany, Italy, the United Kingdom, and the United States.

Professor Channon, following Alfred Chand-

er, suggests that there is a natural evolution of the *strategy* and *structure* of industrial enterprises: in strategy, from the production of a single item to a diversified, multiproduct output; and in structure, from a functional management to a multidivisional structure. Corporations naturally evolve from the classic single-product, entrepreneurial type to the more complex multiproduct, multidivision managerial organization characteristic of mid-twentieth century capitalism. Within the multiproduct stage, there is a similar evolution: other products are introduced, but one is dominant; then the firm produces a number of related products; finally, it begins to produce a range of unrelated products, and frees itself from a dependence upon any particular raw material, technology, or market. Thus, structure and strategy evolve toward the modern conglomerate model.

To test this framework, Channon examined the production strategies and internal structural development of the one hundred largest industrial enterprises in Britain during the twenty-year period from 1950 to 1970. This is the meat of the book, and the detailed chapters on the groups of firms which Channon studied — the "undiversified enterprises," the "technological diversifiers," and the "acquisitive diversifiers," — make rewarding reading for anyone interested in the modern British economy.

But while the book provides a very useful view of the recent development of British industrial enterprises, it also raises a number of serious questions, particularly for the student of politics. First is the way the author deals with the concept of development. He includes a neat but very brief overview of the "British industrial environment" in which he reviews changes in the pattern of supply and demand, the growth of competition, and the impact of technological change in this period. But Channon makes no effort systematically to relate these changes in the environment of industry to the changes taking place within enterprises. (Indeed, he fails to explore the most interesting relationship upon which he touches several times: the differential impact of competition on different industries.) Instead, the author seems to see the process in almost nineteenth-century terms as "the natural process of corporate evolution," an autonomous and "inevitable" (his term) process which requires no further explanation.

Because of this starting-point, Channon devotes little attention to those factors which might have initiated, influenced or limited the process of change. In particular, he minimizes the role of government. Except for anti-monopoly legislation, the impact of public policy is ignored or treated cursorily. Yet, while government "planners" have found how difficult it is to exert influence on individual firms, it is still hard to believe that neither successive governments' macroeconomic policies (twenty years of "Stop-Go") nor the detailed intervention in industry which became increasingly frequent during this period affected patterns of industrial development and change.

Channon makes no bones about his belief that the free operation of the large multinational conglomerate is central to the health of the modern economy. Government's role should be limited to preparing the way for these organizations, and then repairing the damage that they do: "Government should address its policies toward smoothing this process [of corporate evolution] and relieving the social problems it creates rather than attempting to hold back the inevitable" (p. 244).

The author argues that there is a natural and inevitable process of corporate evolution toward the American conglomerate model, and he identifies Britain's national economic goals with the achievement of this objective. The "American model of industrial society" is not the only possible choice, but it is the one Britain has chosen: "An alternative model of industrial society, such as the Japanese, also seems to work well, but Britain has chosen to use the American model" (p. 245). Channon's data, however, while revealing increasing product diversification among these large firms, do not indicate that Britain is in fact moving in this direction. What he describes is a range of types, not a pattern of development. As he points out, the largest and most important British firms are among those which have not diversified beyond a dominant product (largely because of government control), and this has not changed significantly in recent years. Those firms, the "acquisitive diversifiers," which have moved closest to the conglomerate model have done so out of market weakness, and they have not been particularly successful.

The nature of the conglomerate is to be guided by available markets rather than by products; it aims to realize maximum profits by selling whatever can be sold to whomever will pay for it. This market orientation cuts across deeply held values in British society, not only in industry but in the British political culture as well, where both Tories and socialists reject the notion of the "acquisitive society"

(though, to be sure, not necessarily "Liberal-Conservatives" of the Joseph-Thatcher variety). At the same time, in Britain (as in the United States) there is increasing popular concern with the dangers of a "consumer society." It is not clear that Britain has chosen the "American model" of industrial society (even if this accurately fits the United States, which is questionable). The future pattern of industrial organization remains an open question, and one in which governments will be increasingly involved. Channon's book is an extraordinarily useful examination of British industry, but its major premise needs to be re-examined.

STEPHEN BLANK
The Conference Board

Workers' Self-Management in Algeria. By Ian Clegg. (New York: Monthly Review Press, 1971. Pp. 249. $2.95.)

Révolution et Autogestion Rurale en Algérie. By Gérard Duprat. (Paris: Armand Colin, 1973. Pp. 486. 98F.)

If, as the late Joseph Levenson suggested (*Confucian China and Its Modern Fate,* [Berkeley: University of California Press, 1965] III, p. 124), the Chinese Marxists made their revolution "against the world to join the world, against their past to keep it theirs, but past," western Marxism has never adequately coped with the rise of ethnic and national as opposed to class identities. Ian Clegg's work is no exception. His analysis is clear, excellently written, and honest—a model textbook for students of North Africa or comparative revolution. But the interpretation must be criticized. What Clegg sees as fundamental — class conflict in independent Algeria — can better be viewed as the efforts of some Algerians and their foreign advisors to establish a framework of political discourse for a fragmented elite. More than in most newly independent countries, public efforts to define Algerian identity were phrased in Marxist rhetoric, but the superstructure of ideology and legislation did not reflect underlying class interests. Rather the search for an ideology to guide the revolution reflected the need of very disparate segments of the elite for some consensus on national purpose that might legitimate their new statuses.

Until 1965, when Boumedienne removed Ben Bella from office, *autogestion,* or workers' self-management, was the regime's principal legitimating myth. Clegg rightly points out that practice had considerably diverged from theory even before Boumedienne's coup and consequently that the coup "was not a counter revolution in a classic sense," but it does no follow that "the coup was part of a class struggle that was already under way" (p. 134) Clegg argues that the workers who in 1962 and 1963 took over the estates and businesses of departed settlers engaged in an "action of seizing the means of production" which "can objectively, only be described as a class action' (p. 109). He admits that in most cases the workers' motives were hardly revolutionary, but still the awkward conclusion is that "they were driven by material necessity to give actuality to their objective situation as the negation of capitalism" (p. 172). Clegg is making the behavioralist assumption that the meaning of an action can be neatly (and undialectically) separated from the intent of its author.

The other protagonist in Clegg's class struggle is the new middle class which emerged in Algeria's new state bureaucracy. It is upwardly mobile, but its life style and control of the means of production define it economically as a class. "This dual formulation of an elitist life-style and objective relation to the means of production and political power has close parallels with the class characteristics of the Russian bureaucracy" (p. 115). But Clegg's formulation requires this class to pull itself up by its bootstraps and create its means of production. He admits that it existed only in "embryonic" form under Ben Bella (when Algeria was living in administrative chaos precipitated by an unusually abrupt transfer of power from the French), yet he wishes to ascribe the eclipse and defeat of *autogestion* to the machinations of this class. Curiously, he and virtually everybody else who has tried to analyze Algeria's class structure have overlooked indigenous landowners. These are dismissed as anti-Western, "not a coherent political force," and only tenuously related to Algerian politics (p. 111), yet their presence is considerably less metaphorical and metaphysical than that of the administrative bourgeoisie. In the modern sector, 8500 Algerians each owned more than 100 hectares, and their family ties with top officials were known to many Algerians if not to Marxist publicists. Considerably more astute and revolutionary than the proponents of Algerian *autogestion,* Boumedienne saw where the real danger to his revolutionary design lay. He quietly consolidated control over his administrative infrastructure, and then in 1972 launched an agrarian reform to break the economic basis

of any alliance between landowners and segments of the bureaucracy. Hypnotized by his vision of class struggle, Clegg missed a real political one.

If, moreover, the state is by definition counter-revolutionary, so also are its economic plans — investment in capital-intensive heavy industry that Algerian planners hope will be the armature of a thriving industrial society. Consistent with his vision, Clegg argues, in fact, that industrialization is "economic lunacy" (p. 188), except in the cases of big countries like the Soviet Union or China. So, too, comprehensive trade blocs "in competition with neo-imperialism" are ruled out as impracticable. Presumably Clegg would also consider impracticable, if not reactionary, Boumedienne's leadership in OPEC and his efforts to effect a fundamental transformation of terms of trade in favor of the third world. But then, on Clegg's view little can be expected of the third world other than to serve occasionally, as with Algerian self-management, as a laboratory for recycling outworn nineteenth-century ideas.

Duprat's work covers much the same ground as Clegg's, from the emergence of *autogestion* in 1962 to its reorganization under the supervision of state directors in 1969. Duprat's analysis is also informed by a rich understanding of Marxism and other political theories, notably those of Rousseau and Proudhon. But here the similarities end. Whereas the pieces of Clegg's narrative cohere in a theoretical design which may be criticized, Duprat's theories illuminate the pieces as in a kaleidoscope which rejects any simple design. If his work thus comes considerably closer to Algerian realities, it remains as difficult as these realities for the reader to apprehend. I confess to having read it twice during a period of more than a year without being able to decipher any overall thrust, and I tentatively infer the fault to lie with the writer rather than the reader. Turgidly written, poorly edited, and without an index, this thesis for the Faculty of Letters, Nanterre, nevertheless deserves a favorable review on two counts.

First as a study of ideology which tries not to be ideological, it deciphers Algerian utterances, clarifies code words, and sympathetically analyzes logical contradictions and the political or factional tensions underlying them. It does not reduce ideas to social classes or class struggle but rather seeks to understand how perceptions of class, influenced by ideological developments outside Algeria, could provide specific political references for people attempting to construct political space out of the legacy of revolution. Unlike Clegg, who reduces the Algerian revolution to verbal hassles over *autogestion*, Duprat accepts the fact that Algeria experienced a revolution between 1954 and 1962. He also argues (against the oversimplified view that the FLN did not have "an ideology") that a "revolutionary project" emerged implicitly from the years of struggle and was articulated in a variety of suggestive if inconsistent declarations by diverse groups within the FLN. One available symbol, first mentioned in a trade union declaration in 1961, was *autogestion*. Its establishment as a myth, its life history, and finally its death were significant mainly as phases in Algerians' searches for public meanings. If *"l'autogestion arrive à sa maturité sans atteindre l'âge de raison"* (p. 443), the death of the myth also closed one gap within Algeria's revolutionary experience between theory and practice.

Second, the work is exceptionally rich in political detail, relating what was happening on the self-managed estates with intra-elite politics in Algiers. Duprat gathered invaluable written materials from a trade-unionist active in Ain-Temouchent, an *arrondissement* west of Oran. He was also able personally to interview many of the workers who tried to manage farms in the area. Some of their attitudes and motivations make fascinating reading. Their ambivalence toward the state — resentment against external interference coupled with expectations of outside assistance — is good evidence for Duprat's contention that *autogestion* itself stimulated a countervailing bureaucracy. Unfortunately his data are neither quantified nor elaborated in an extended case study of *autogestion* in Ain-Temouchent. The book, then, unlike Clegg's is probably for Algerianists only.

CLEMENT HENRY MOORE
The University of Michigan

Comparative Political Socialization. Edited by Jack Dennis and M. Kent Jennings. (Beverly Hills, Calif.: Sage Publications, 1970. Pp. 135. $3.95.)

The slender volume of five studies is a useful addition to the field of comparative political socialization. Each is based wholly or in part on sample surveys. Joseph Adelson, whose work with adolescents also includes projective techniques, chose not to report on these results, which is regrettable. All their studies make a serious effort to set the inquiry into a larger theoretical context. The success of this effort is, however, at times severely restricted by the

very method of the sample survey or by the type of survey with which the authors had to content themselves. This is noticeable in the piece by Kenneth Prewitt, George Von Der Muhl, and David Court, which offers extremely sophisticated thoughts on the not-always-defensible way in which political socialization scholars have treated certain independent variables, such as age. The very design of their own study, however, does not permit them the type of inquiry they advocate (a fact of which they are fully aware), so that instead they had to choose "the strategy which approximates the ideal socialization study" (p. 78). None of the five studies concentrate on very young children, but instead concentrate on adolescents or adults, whose political orientations presumably have more direct political import.

Of the five articles, two are cross-national. Jack Dennis and Donald McCrone report on the development of party identification in western democracies. Judith Gallatin and Joseph Adelson report on the development of political thought in three nations. A comparison of the two studies clearly illustrates the differences in approach between the psychologist and the political scientist. The Gallatin and Adelson piece essentially is a learning study that asks when and how the young person begins to apply formal operations (to use Piaget's terms) to political thinking. Dennis and McCrone instead study the strength of party attachment, the transmission from parent to child, and variations therein across nations, as well as the possible explanations for such variations. Their focus — even if only indirectly — is the political system; Gallatin and Adelson's is the individual.

One of the most interesting findings in the latter piece is that formal operations in political thought seem to develop much later than they do in other intellectual endeavors. The authors conclude that "in all likelihood, this apparent lag in political thinking is a function of the child's narrower social perspective" (p. 111). Another explanation, however, suggests itself. Could it be that home and school ignore the task of "engaging" young people politically? If 15-year-olds can be taught formal operations in algebra and moral thought, one may be permitted to wonder if the same could not be done for politics. The differences in responses among children of different nationalities parallel, as the authors point out, those observed for adults in Almond and Verba's *Civic Culture*. Whether they or Almond and Verba should make these generalizations without understanding what some of the practices mean in different national settings is another question. It is a question one could direct to each of the volume's sections.

Dennis and McClure document that party identification is strongest in the U.S. and U.K., and least strong in France. Rather than look for familial differences, one might trace strength to the stability and small number of parties. Thus I feel certain that pre-World War II German adolescents would have greatly paralleled those of postwar France, not because of any intrinsically similar family patterns but because of the similarity in voter volatility. Where parents vote Communist one year and then desert that party in the next election, young people are not apt to develop stable party identifications regardless of the reticence or openness of family political discussion.

Intra-nation comparisons are made in the essays by Akira Kubota and Robert Ward; by Daniel Goldrich; and by Prewitt et. al. Kubota and Ward imaginatively test the assertion of discontinuities in Japanese politics as expressed in stability of party identification. Their conclusions offer a corrective to the frequently asserted charge of the sharp generational break in postwar Japan. Their study offers ample illustrations of the difficulties encountered in cross-national comparisons. They observe that "don't know" responses are considerably higher in Japan than in the U.S. and suggest that this might be indicative of greater political instability. An alternative explanation is feasible. Maybe genuine not knowing is of the same magnitude in both countries, but American youngsters may be more likely to volunteer an opinion even when they lack knowledge. Again, we can only caution that few conclusions should be drawn from cross-national data unless we are certain of the cultural equivalence of the concepts used and the responses received.

Prewitt and associates performed a most ingenuous analysis of the impact of the school environment on attitude development and/or change (religious orientations in this case) among adolescents enrolled in Tanzanian religious and government schools. This is one of the few field studies that actually controls for differences in school environment, although others have talked about the importance of schooling. Some of the tables lend themselves to different interpretations from those given by the authors, but the significance of the piece lies in the attempt to provide a contextual analysis.

Therein also lies the importance of the Goldrich piece on the *poblador* of Latin America.

He relates actual political experiences (encountered in the attempt to secure housing) to political attitudes, something political scientists have promised to do for years but have seldom done. Goldrich's piece also has the distinction of being the only one in the volume on adult political socialization — another sadly neglected area.

The selections have all the virtues and drawbacks of the whole field of political socialization research. None deals with the *process* of socialization; none is longitudinal; national histories are not as integral a part of the designs as they should be. All, however, show considerably more theoretical concern and sophistication than was the case 10 years ago. All are carefully executed and will add significantly to the slowly growing volume of comparative socialization research.

ROBERTA S. SIGEL

Rutgers University

British Factory—Japanese Factory: The Origins of National Diversity in Industrial Relations. By Ronald Dore. (Berkeley: University of California Press, 1973. Pp. 432. $11.75.)

Modernization has been considered a process that began in England and Western Europe and then spread, or is still spreading, to the rest of the world. The convergence theory holds that this process will gradually bring all societies into conformity.

Dubious of all grand theories, Ronald Dore, the well-known English Japan specialist and sociologist, has reviewed this hypothesis in the light of a detailed study of industrial relations in two highly industrialized societies. His findings will be shocking to some. He finds that Japanese workers have undergone a "social democratic revolution" (p. 115), whereas British workers have not. The result is that the British workers — class conscious and suspicious of employers — are organized horizontally by trades and are thus buffeted by the labor market from one enterprise to another on the basis of work opportunities and pay, having gained their present "rights" only incrementally in a dogged battle that still goes on with management and at times goes against them. By contrast, the Japanese workers experienced a sudden revolutionary breakthrough in the first few years of the American Occupation that among other things gave them "maximum hours, minimum holidays, overtime provisions, etc., which were more generous than in any other capitalist country" (p. 116). And even when the Occupation embarked on its anti-Communist "reverse course," rescinding a number of the rights previously given (and still not entirely recovered), Japanese industry had totally accepted the union as a legitimate bargaining agent in wages and protection of persons with rights to full facilities within the factory. Japanese industry had also accepted "the abolition of all but monetary distinctions between the formerly separate 'statuses' of staff and manual workers" (p. 119). One of the many consequences of the lack of this "social democratic" revolution for British industry is that the continuing class hostility prevents the realization of that full cooperation between management and workers that is seen in Japanese factories. Enjoying "tenure" and a pay system based substantially on seniority, Japanese workers are organized in "enterprise unions" in which they feel an allegiance to the company and work hard for the corporate prosperity. They are thus "organization-oriented" rather than "market-oriented." Seeing this as a world trend, Dore asks if Britain is catching up to Japan (Chapter 13).

Answering affirmatively, he ends up by supporting a convergence theory after all, but one differing from most others in three respects. (1) He recognizes that the desire for social equality comes to modify the linearly increasing technological complexity that would otherwise create hierarchy. (2) He finds that terms and conditions of employment, therefore, tend to be less influenced by the labor market than by what the functions within the enterprise call for. (For example, the Japanese worker, confident of not losing his job, is much more amendable than the British to being moved around to different tasks within the larger enterprise.) And (3) he argues that the later developing societies can jump ahead of the earlier developers in various ways (which the Japanese have done in education, personnel management, etc., as well as in achieving closer, and in that sense, more egalitarian, personal relations).

Still, Dore does not contend that the need for handling complex technology and organization and the need to achieve status equality necessarily impose identical institutional solutions on all advanced industrial economies (p. 419). In short, the world of the future will not be monotonously uniform for three reasons: (1) the pre-industrial histories of various nations continue to pattern them differently; (2) so do their peculiarities of geography, popula-

tion, etc.; and (3) how and when they industrialized makes a great difference.

Despite the prospects of continued future diversity, Dore's hypothesis is that the main trend of industrialism in the world is toward the organization man rather than toward the man who values individualism and "freedom." The "rationality" involved works better in large-scale enterprise (than in small business), fed by an educational system based on the "merit" of success in examinations. One can discern unmistakably the face of Max Weber behind Dore's approach here, but that is hardly comforting to people who hold dear the values of individual liberty.

The methodology used in this study is almost faultless ("apples" truly being compared with "apples"), the historical scholarship impressive, and the writing superb (a real pleasure to read). Nevertheless, on the basis of recent trends in Japanese society, I have the optimistic feeling that Japanese society has already begun to undergo a series of profound social changes that may well undermine the almost idealized (but frightening) image of the hard-working, submissive, and group-oriented Japanese labor force, described by Dore. This can already be seen in the widespread reaction in Japan to the headlong dash toward economic growth at the expense of the environment and of the quality of life, taking the form of citizens' movements, individualism, and nonconformity. But these are changes only beginning to affect the society whose industrial relations are meticulously analyzed here. Indeed this study has much to offer the political comparativist of both developing and industrialized countries, as well as those interested in political sociology and economy, and it once again demonstrates how important is the in-depth, truly comparative and integrated, study, still so rare, of which this is a remarkable example.

Arabs and Berbers. From Tribe to Nation in North Africa. Edited by Ernest Gellner and Charles Micaud. (Lexington, Mass.: Lexington Books, 1972. Pp. 448. $15.00.)

Arabs and Berbers, a work published in 1972 by Ernest Gellner and Charles Micaud with eighteen collaborators, stimulates a dualistic and contradictory interpretation. To a certain extent, it provides a representative sampling of various studies devoted to the traditionally antithetical problem of Arab and Berber societies. Seen thus, the book is indeed a logical outcome of this question. At the same time however, it opens a new chapter in the study of political anthropology of the Maghreb, for it challenges that very issue. Even in the introduction by E. Gellner, the well known division between two populations considered ethnically irreducible is presented as the outcome of an entire network of artifices, if not of a deliberate mystification. Furthermore, a reading of the various contributions admirably reflects this ambivalence: continued prevalence of the theory of Arab-Berber (pseudo)-opposition as well as criticism and ultimate dismissal of the same theory. In other words, the authors of *Arabs and Berbers* prove that the myth is still alive even as they denounce it.

"Divide the adversary" is an old formula in war or political strategy. The "discovery" of a Berber minority and recognition of its importance (or rather fabrication of it for political manipulation) date back to French colonization, to colonial ethnologists, and to the theoreticians and politicians of colonialism; more specifically, they spring from Algeria at the end of the last century. The "Kabyle myth" of the years 1840–1870 represented a primary attempt, but at the time, the endeavor consisted of a search for the "good savage" and those native pillars of colonization who were capable of helping the French cultivate the land if not run the country. By 1890–1900, there was no longer any question of an attempted political and economic recuperation of the "Kabyle" minority. The triumphant colonial system sought to confirm its supremacy. To that end, it pitted two groups against one another by emphasizing their differences. In the extreme, we fall into wittingly opposed stereotypes: the lazy Arab, a thief and ever-potential traitor; the industrious Berber, upright and loyal. For it was imperative to valorize the numerically inferior of the two groups. Whence special legislation; Kabyle representation within the "Délégations financières," that assembly of mere façade; Berber cultural politics; schools . . . and so on.

Berberism is thus, first and foremost, a political construct and the Berber-Arab antinomy an instrument of domination. What currently obfuscates comprehension of the issue is the work of the social sciences which propagated the theory and then categorized the mentalities and modes of behavior. When officially invited to prove the scientific grounds for such a compartimentalization into two races, the colonial ethnologists hardly strove

to seek proof of the assertion. To cite but one example, in 1910 E. Doutté and E.-F. Gautier exploited in behalf of the "Gouvernement général" of Algiers the findings of an *Enquête sur la dispersion de la langue berbère*, a study which proved the progressive recession of Berber in response to the extension of Arabic. Intended to facilitate the reinforcement of pro-Berber politics, the study justified *a posteriori*, a choice already made, rather than preparing that choice.

A reading of the major authors, Hanoteau and Letourneux, Masqueray — from whom Durkheim borrowed the concept of segmentarity so widely diffused by Ernest Gellner — confirms the growing interest in studying the Berbers in Algeria. And we find the traces of such an attitude immediately following the occupation in Morocco. Augustin Bernard has left us a "mission in Morocco" (in the form of a report to the Governor General of Algeria) which merely reproduces on Moroccan soil the ethnics divisions elaborated with regard to the neighboring country. Edmund Burke III demonstrates admirably (pp. 175–199) the influence of Hanoteau and Letourneux which extended as far as Lyautey's entourage, and can be recognized in the drafting of the *dahir* of September 1914. It is regrettable, however, that no author sought to pinpoint the true sources of berberism within the ethnic literature of Algeria. Moreover, the same criticism can be leveled against the work as a whole, for it is decidedly slanted toward Morocco, whereas Algeria is the subject of only four of the twenty-three studies which compose the collection.

But this French "invention" could not help influencing not only the scholars and politicians but also those most directly concerned, namely, the Berber-speakers themselves who were constantly reminded how much their life styles, rules and laws, religious policies, economy, culture and organization differed from those of the Arabs. Thus the image presented to them by the Europeans brought about alterations within the very society that had been observed. The colonized group underwent an unconscious internalization of those values that had been filtered through the colonial analysis. And, in part, this is one of the basic themes of the work: how an academic myth altered the very society which it purported to explain.

The first part, therefore, examines the "traditional base." The real issue, it would seem, is not to rediscover the tribe (and, "tribe *and* nation in North Africa" would be a more fitting substitute than "from tribe to nation . . .") but rather to understand the connotations of the word "tribe" in the Morocco of 1918, 1945, and finally in 1970. In this vein, it is interesting to compare Mrs. Vinogradov's paper on a *Taraf* Berber tribe before the protectorate with David Seddon's observations on the ethnic populations of Northeastern Morocco from 1870 to 1970. It seems that the word tribe has become a mere appelation, an administrative term with no real sociological base. The true dissimilarities then, are not to be found between Arabs and Berbers, but between groups factions, and clans. The determining factors are the relations of various groups with the central power, the inequalities of wealth, and the intensity of bonds of friendship or enmity.

Several contributions in the second part carry us further along in the same direction. Louis-Jean Duclos points out that first and foremost, the national unity of Morocco, even before colonization, transcended ethnic divisions. This unity, moreover, continued to develop despite the French government's policy of favoring Berber elements. For example, Abdeslam Ben Kaddour has shown that Berbers occupied key posts more because the French had placed them there than because of any alleged Berber superiority. With the advent of the nationalist movement, ethnic rivalries created or inflamed by the colonialists diminished. And above and beyond considerations of independence, nothing indicates that the resurgence of certain particularisms is due exclusively to ethnic motives. It is certainly not shown, for example, in Octave Marais' analysis of the political evolution of independent (post-colonial) Morocco, nor in William B. Quandt's study on the Berber minority within the political elite of Algeria; moreover Jeanne Favret's article which opens the third part, "Ethnicity and Social Change," establishes that the agitation in Kabylie and in Aurès after 1962 is a manifestation of supernationalism, of ultra-integrationism rather than of a policy of separatism.

The final section of the book is devoted to the *"coup manqué"* of Skirat, to use the term of John Waterbury; the concluding statements are made by Charles Micaud. As already stated, the major portion of the work vacillates between the desire to maintain the Arab-Berber dichotomy as a means of investigating the past and present, and the temptation to demystify that very dichotomy, once and for all. Ernest Gellner states in the introduction that he purposely allowed each contributor to express him/herself as he/she saw fit. The same am-

biguity marks the recent work by Montagne: *The Berbers, Their Social and Political Organization* (translated and introduced by D. Seddon; Preface by E. Gellner [London: Frank Cass, 1973]), as well as the reprinting of Anthony Wilkins's 1900 study: *Among the Berbers of Algeria.* Are Berber studies being renewed in the United States and in England? Are they concerned with refurbishing those concepts initially forged by colonial anthropologists? Or is there an attempt to rethink berberism by trying to understand who designed it and for what purpose? In the meantime, all of these studies point to one fact: that contemporary studies teach us less about the Berbers of North Africa than about France and her political entanglements, about a France ensnared by a myth that she herself created.

Decision-making and Power in the British Conservative Party: A Study of the Indian Problem. By Sailesh Ghandra Ghosh. (Calcutta: Oceania Publishing House, 1972. Pp. 235. $8.00.)

The policy adopted toward the independence of India was a forerunner of the liberal attitude taken toward the winding-up of the British Empire after 1945. As early as 1917, the Montague Declaration had recommended the establishment of partially responsible government in India. The years between 1929 and 1934 saw the evolution of a new policy, which culminated in the Government of India Act of 1935. While the Viceroy was still to exercise exclusive control in some areas, the Act set up a Federation in India with strong provincial rights and an increased measure of responsible government at the center.

Throughout the 1929–1934 period, the Conservative leader Baldwin lent his support to a greater measure of independence for India. Many in his party, however, were outraged at what they saw as "surrender" to the militant nationalists led by Gandhi, and went all out to reverse Baldwin's position. These intraparty dissensions form the focus of this work by Professor Ghosh, who now teaches at the University of New South Wales. His major purpose is to use the India question to throw light on the distribution of power in the Conservative party through an analysis of its decision-making processes.

Ghosh contends that previous accounts of the distribution of power in the Conservative party, notably that of R. T. Mackenzie in *British Political Parties,* have been too concerned with the structural sources of power giving a misleading picture of the role of the leader. Instead, Ghosh contends that "power in the Conservative party is dispersed" (p. 15) and that "in spite of his formal power, Baldwin could not decisively influence the Conservatives' decision" (p. 5). The bulk of the book is dedicated to showing the limits put on Baldwin's power by the dissent of his followers.

The author succeeds quite admirably in demonstrating a number of areas in which Baldwin was forced to modify his position under pressure from party colleagues. For instance, backbench pressure caused him to modify his support for the Dominion Status Declaration of 1929. Similar pressure forced him to support the cautious posture of the Conservative delegation to the Round Table Conferences of 1931–1932. Third, the expressed fears of the leaders of the National Union and the regionally powerful Manchester Chamber of Commerce resulted in stronger safeguards for British trade in the 1935 India Act than the 1933 White Paper had advocated.

While it does show the limits on Baldwin's power, however, the book is less useful in providing a general theory of power in the Conservative party relevant to the student of contemporary British politics. It lacks both a rigorous theoretical framework, and a statement of conclusions linking the author's contentions directly to his evidence.

A particularly crucial omission is any attempt to place this study within the context of the post-1867 Conservative party. For instance, the reader begins this book with the notion that the 1922 Committee is perhaps the crucial constituency whose support a Tory leader must maintain, while the National Union is, according to Ostrogorski and Mackenzie, a mere "handmaid" to the party in Parliament. One is therefore perturbed that, although the 1922 Committee is relegated to a very indirect treatment, the National Union's deliberations receive extended attention.

Furthermore, I wonder whether India was an appropriate issue to use in the search for greater understanding of the distribution of power in the Conservative party. Party revolts on Suez, Rhodesia, and the Common Market suggest that Tory dissension and overt rebellion are most acute on questions of empire or national sovereignty, a category clearly encom-

passing India. In addition, one should hesitate to draw general conclusions about Conservative leadership from the experience of Baldwin. Despite his long tenure in the office, he was in some ways the least successful and most vulnerable leader of his party in the period between Balfour and Heath.

A final drawback is that the book has been very poorly indexed and proofread.

These weaknesses, however, should not detract from the strengths of the book. Ghosh has provided an interesting description of the pattern of dissent on the question of India policy and its role in causing Baldwin to modify his position. He has also provided a suggestive counter to those modern studies of political power which stress its accretion and concentration rather than its limits and diffusion.

GEOFFREY LAMBERT
University of Manitoba, Winnipeg

Red Square at Noon. By Natalia Gorbanevskaya. Introduction by Harrison E. Salisbury. (New York: Holt, Rinehart and Winston, 1972. Pp. 288. $7.95.)

On August 25, 1968, as Ms. Gorbanevskaya reports in this careful account, seven Soviet citizens peacefully demonstrated in Red Square in protest against the Soviet-organized military intervention which began the massive process of repression and intimidation that was to put an end to the effort of the Communist government of Czechoslovakia, led by Alexander Dubcek, to "revive socialism" in that country. The expression "to revive socialism" is taken from the appeal "to the Communist Parties of the whole world," issued by the Czechoslovak Communist Party's Extraordinary 14th Congress, on August 22, 1968 and reprinted in this volume (pp. 22–24). The governments of the five Warsaw Pact states involved in the intervention (the USSR, Bulgaria, the German Democratic Republic, Hungary and Poland — Rumania did not participate) of course presented their action as one undertaken in defense of the "achievements of socialism" in Czechoslovakia.

Thus, two very different interpretations of socialism, and also of democracy, clashed. On the one side was an essentially Stalinist, and — if the term democracy has more than demagogic value — obviously reactionary conception. It postulates that an infallible and omnipotent party apparatus must impose its will on the membership of the ruling party and on the "masses" of the USSR and other "socialist" polities. This pattern of rule is viewed by the Kremlin as the proper application of "Leninist" principles. Opposed to this was the approach of the Dubcek forces in Czechoslovakia and of the Democratic Movement in the USSR (some of its participants were Communists, some were not), who believed that to pretend that socialism could exist without democracy was to make a mockery of the very idea of socialism. These anti-Stalinist, democratic reformers were prepared to run great risks in defense of their convictions.

Of the seven Soviet citizens who defied their government by organizing a sit-down demonstration at the historic Execution Ground, near the Kremlin, five (Larisa Bogoraz, Konstantin Babitski, Vadim Delone, Vladimir Dremlyuga, and Pavel Litvinov) were tried on charges of maliciously slandering the Soviet state and social system (under Article 190/1 of the RSFSR Criminal Code) and of grossly violating public order (Article 190/3 of the same code).

As became clear from statements of the prosecution, and also of the judge (who echoed the prosecution, and severely obstructed the defense) at the trial in October, 1968, the first charge was based on the prosecution's interpretation of banners carried by the demonstrators, which urged withdrawal of the occupation forces and otherwise criticized the intervention. The second charge was supported by witnesses clearly assigned by the Soviet authorities to this task; other witnesses, who supported the defendants' arguments, and those of defense attorneys (four of the accused had attorneys; Bogoraz conducted her own defense) that no disturbance of traffic or public order had occurred, were not permitted to testify. Despite the flimsiness of the government's case, the five persons who were tried received severe sentences of detention in forced labor camps or exile.

The other two participants in the demonstration were declared insane, and spent time in "special psychiatric hospitals" under security police (KGB) auspices. One of these, Victor Feinberg, who had four of his upper front teeth knocked out by plainclothes operatives during the demonstration, was recently permitted to leave the USSR. The other, the poetess Gorbanevskaya, the compiler of this book, had, at the time of the writing of this review, been released from confinement, but had been refused permission to leave the USSR.

Gorbanevskaya's careful and apparently full record is useful and interesting in a number of connections. For one thing, like other remark-

able accounts of Soviet political trials of the 1960s, such as Alexander Ginzburg's record of the Sinyavski-Daniel affair, or Pavel Litvinov's compilation on the trial of Ginzburg and Yuri Galanskov, *Red Square at Noon* sheds light both on the progress made since the death of Stalin in reducing the inhumanity of the Soviet judicial process and on the vast distance still to be covered before anything like the "rule of law" can be said to have come into existence in the USSR.

Even more important, perhaps, than what documents such as this tell us about contemporary justice in the USSR and related matters, is what they indicate about political change in the future. Of course, the efforts of people like Bogoraz, Litvinov, Academician Andrei Sakharov, and others to promote "democratization" in the USSR have failed. However, the facts that the effort could be made at all, that it was made, and that even in the highly sensitive field of foreign policy, some Soviet citizens dared to protest, are significant. Perhaps at some future date such efforts will be more successful than they were in the late 1960s and early 1970s.

But if the Red Square demonstrators established a precedent that may inspire future reformers who, one hopes, will be more fortunate than their predecessors, their fate is also a warning. Not only was the Soviet regime able to crush them with ease, but — and this is discouraging — there is every reason to believe that the Soviet "masses" were at best indifferent to the libertarian message of the Litvinovs, the Grigorenkos, and the Sakharovs, and at worst downright hostile.

It could of course be argued that the organizers of the demonstration were foolhardy to challenge the Kremlin on such a sensitive issue as the invasion of Czechoslovakia, in view of the taboo in Soviet political culture against such open defiance of policies not only decided upon but, in this case, already implemented. However, Anatoli Yakobson, a leader of the Democratic Movement, in a letter included in this volume, effectively countered criticism of this nature when, noting that since the Sinyavski-Daniel trial no arbitrary act of the authorities had passed without public protest, he added, "That has the makings of a precious tradition, a start to people releasing themselves . . . from humiliating fear and participation in evil" (p. 285). But, of course, one can agonize over whether history will mourn the activists of the Soviet Democratic Movement as martyrs or celebrate them as prophets. In the meantime careful study of the words and deeds of the Soviet democratizers, and of the Kremlin's response thereto, is indispensable to understanding contemporary Soviet domestic policy, which in turn shapes and constrains Moscow's foreign policy.

FREDERICK C. BARGHOORN
Yale University

The Politics of Soviet Agriculture, 1960–1970. By Werner G. Hahn. (Baltimore, Md.: Johns Hopkins University Press, 1972. Pp. vii, 311. $12.50.)

Focusing upon the policy debates between 1960–70, Werner Hahn presents a chronology of the agricultural issues that affected the political careers of Soviet leaders. Professor Hahn's approach is "to identify individual leaders' positions on issues through careful study and comparison of their statements through the years, to identify the role of these leaders and their viewpoints in disputes and decisions, and to compare personnel shifts and career patterns with policy changes and political disputes" (p. xii).

Although the book contains an extremely useful collection of data, it lacks an explicit theoretical perspective and is particularly weak on analysis. No attempt is made to relate the vast amount of information to the broader context of Soviet political behavior nor to the current theoretical discussions among Soviet specialists. Hahn has evidence, for example, to challenge some of the assumptions of interest group theorists. His data demonstrate that power struggles and policy debates occur among individuals rather than groups. A model of patron-client relationships would be the most applicable to his study, since he refers continually to the purging or promotion of a leader's protégés at lower levels of the party and government hierarchies.

Hahn's book is divided into two parts. Part One begins with the 1959 harvest disaster in Kazakhstan and the demotion of Khrushchev's supporters, N. I. Belyayev and A. I. Kirichenko. It recounts that by the beginning of 1961, Khrushchev managed a comeback and installed a new team (T. D. Lysenko, K. G. Pysin, G. I. Voronov) to implement his agricultural programs; the team soon split, with Voronov and Pysin becoming the dominant forces. Despite the chapter headings, Hahn de-emphasizes Khrushchev's personal leadership and pays particular attention to the careers of Voronov and Lysenko between 1962–65. He tells us that

the 1962 party re-organization initially put Voronov in a powerful position regarding agriculture (in March) and then contributed to his decline (in November). After the 1963 Virgin Land drought, Voronov began to oppose Khrushchev and to support the alternative views of A. I. Berayev and Sh. Sh. Khayrullin. Voronov also continued his opposition to Lysenko (who still had Khrushchev's support). Lysenko's own position had been weakening at least since March 1962 and reached its nadir in early 1965. Hahn concludes this section with the fall of Khrushchev and the reversal of his policies.

Part Two describes the conflict between Voronov and Polyanskiy (1965–70) in terms of the former's support for organizational reforms that would reduce costs of production and increase agricultural efficiency, and the latter's preference for investing more resources in agriculture. They differed also on the issue of more direct state control over kolkhozes (Voronov) versus an elective administrative system for kolkhozes (Polyanskiy). Hahn considers D. S. Polyanskiy the chief spokesman for the agriculture lobby, which suffered a setback when Brezhnev supported the transfer of funds to consumer goods in March 1967. This was later reversed, however, when Brezhnev joined Polyanskiy to increase the resources for agriculture after the meat crisis of 1969. Voronov fought this policy and implemented his own programs in the RSFSR, which contributed to his final defeat after the Brezhnev-Polyanskiy position prevailed at the 24th Party Congress.

Hahn claims that the second part of his book shifts its emphasis from debates over agricultural organization and the techniques to be used in agricultural production (1960–65) to debates over priorities between agriculture and industry (1965–70). He attributes this to the (relative) lack of public discussions of agricultural techniques after 1965, but admits that differences may have persisted within the political leadership. This seems to be an artificial distinction, since the competition between industry and agriculture is clearly visible in the earlier period (e.g., pp. 102–116), and the disagreements over agricultural policies are prevalent throughout the rest of the book. Hahn shows how the amount of resources invested in agriculture vis-à-vis industry depended indirectly on the agricultural output of the previous year, i.e., greater investments usually followed droughts or meat shortages. But it is difficult to assess these expenditures outside the context of the nonagricultural demands being made at the same time.

What conclusions can be drawn from the substantive material presented in Hahn's book? In terms of political behavior, we see a continual hustling among secondary leaders to improve their own status in the Kremlin hierarchy and to have their policies prevail. Hahn's study demonstrates again that Soviet political conflict is not limited to a narrow circle of Politburo leaders; policy debates on agriculture involve many individuals, including leaders of territorial party organizations and agricultural scientists.

One also receives the impression of perpetual movement and uncertainty among the top leaders. Difficulties in Soviet agriculture seem to stem, in part, from the inability of the leadership to implement a given policy for any length of time. Due to the differences of opinion among the secondary leaders and the inability of the primary leader to impose his policies upon them, there is a continual shifting of programs as the political situations of individuals change. To a certain extent, this is a circular relationship because agricultural problems themselves are a factor in the realignment of political positions. Nevertheless, the personal career interests of individuals, their reluctance to compromise viewpoints, and the lack of long-term programs have clearly contributed to the failures of Soviet agricultural policies.

Most of Hahn's presentation is based upon inferences from the Soviet press. Although generally adequate, there is not enough documentation for some of the speculative judgments and assertions regarding "purges" and other changes in personnel. Nevertheless, Hahn has provided a useful source of data on the relationships between agricultural disputes and individual political positions in the Soviet Union between 1960–70. His extensive reportage is followed by several appendices, including the membership of the Central Committee Bureau for the RSFSR and the Heads of Central Committee Sections for the RSFSR, which are valuable reference materials for students of Soviet politics.

LINDA L. LUBRANO
American University

Liberal Politics in the Age of Gladstone and Rosebery: A Study in Leadership and Policy. By D. A. Hamer. (Oxford: Clarendon Press, 1972. Pp. 368. $16.25.)

This is a book on internal party tactics. It is a close-grained, meticulous piece of scholarship

of the type traditional in British historiography, and, within the canons of that genre, it is excellent. How did the party organism function? How was it supervised, directed, kept alive? From extensive research in private papers and other documentary materials, Hamer sees a party afflicted with an inability to stick together once it won elections. To this internal dilemma, as Professor Hamer believes, the party leaders bent their most determined thoughts, and not to the realization of a great vision of what the British nation should become. Men like Joseph Chamberlain argued for the broad front tactic, pursuing social reform across a wide spectrum and thus attracting wide support. Gladstone, ever the man of passion and great causes, sought the unifying element instead in campaigns against single evils: Disraeli's imperialism, or the national refusal to satisfy Ireland's demand for Home Rule. By this means, he hoped to bury the fissiparous inclinations of the "sections" that made up the party — the temperance enthusiasts, Welsh Methodists, land reformers, and the like. Conviction did not lie behind these party tactics, only a concern for holding the party together.

As Hamer sees the matter, then, a party is to be understood in basically structuralist terms. That is, it does things for reasons arising out of its inner organizational needs, not because it is drawn onward by some motivating social vision which it wishes to bring into reality. This is a venerable viewpoint, and it is here argued with great skill and scholarly eclat. Indeed, the author is summary in his dismissal of the work of other scholars — especially, so it seems to happen, that of American scholars. The result, however, is a book in which the terms of reference have a dated air. A revolution in scholarship has occurred in the past fifteen years, with regard to the way in which we understand and undertake to explain party behavior, and it is regrettable that Hamer has not availed himself of this work. Political scientists like V. O. Key, Jr. and Walter Dean Burnham in this country have elaborated the concepts of the critical election and voting cycles, which would have greatly aided Hamer's analysis. Hamer mentions approvingly, but seems unable to make use of, the work of the brilliant Cambridge historian John Vincent, who has uncovered the roots of party life in networks of social groupings in the country at large, and party motivations in a sense of dramatic encounter with bitterly disliked social influences ranged behind the opposition party. G. R. Searle, another Cambridge-trained British scholar, has written an important book whose concepts would have greatly illuminated the problems Hamer was working on: *The Quest for National Efficiency: A Study in British Politics and Political Thought, 1899–1914* (Berkeley and Los Angeles, University of California Press, 1971). Robert Wiebe, in this country, has written a similar work: *The Search for Order, 1877–1920* (New York, Hill and Wang, 1967). Of course, Lee Benson and Samuel Hays have led the emergence of the "new political history," with its close exploration of ethnocultural influences. All of this has given us quite a new framework for conducting research into party history. Books written without benefit of these new vantage points are no longer very convincing.

Thus, where Hamer dismisses the "sections" (ethnocultural groupings) as unfortunate irritants, the new scholarship would find them of the essence of party thought and action. To treat such influences as simply a matter for party tactics is to ignore whole territories of thought and feeling. In doing so, Professor Hamer has lost sight of that vision of the British nation that gave British Liberalism its true momentum and character.

ROBERT KELLEY
University of California, Santa Barbara

Culture and Politics in Indonesia. Edited by Claire Holt. (Ithaca, New York: Cornell University Press, 1972. Pp. 348. $15.00.)

All of these essays seek to delineate what Clifford Geertz, in his afterword to the volume, describes as the "politics of meaning" which lies behind and subtly but profoundly influences the countless acts, conflicts, and passions of the overt political arena. In a country as diverse and eclectic as Indonesia, as he stresses, such an enterprise is a daunting one, especially since there exists no accepted methodology for engaging in the enterprise and all too little in the way of comparable studies in other cultures.

The authors adopt a variety of approaches, according to their interests and dispositions. In their analyses of Javanese millenarianism and Indonesian legal culture, Sartono Kartodirdjo and Daniel Lev call upon Western sociological theory to capture and dissect their phenomena. William Liddle examines primordialism as it expresses itself in and through party politics in North Sumatra by more explicitly political science techniques. Benedict Anderson and Taufik Abdullah, by contrast, seek to penetrate long-established cultural norms impinging on

political ideas in order to explicate the ways in which those ideas manifest themselves in systems and movements of contemporary significance.

Anderson in a brilliant piece of cultural analysis teases out the Javanese idea of power from artistic and literary sources, while Abdullah traces the manner in which Minangkabau religious leaders sought to come to terms with change within their own universe of ideas.

The electicism of the methodologies represented therefore fits well with the electicism of the general subject of discussion, and there appears to be little value in weighing one against another in view of the richness of the insights gained from them all into a wide range of political activity relevant not only to the Indonesianist but also to the many other scholars concerned in different milieus with similar topics or the "politics of meaning" generally.

Geertz sees these essays as important in shedding light upon the continued inability of the Indonesians to reconcile their diversity with the imperatives of a nation state as they conceive it. This is certainly one way of viewing their contribution. Anderson and Kartodirdjo, for example, both show that the ethos of the dominant groups in Indonesia has taken scant account of divergent currents of radicalism that run deep among the Javanese. The Islamic reformers discussed by Abdullah, and the lawyers struggling for a place in social life have fared no better, and both to varying degrees constitute actual or potential sources of disaffection for any centralized regime in Indonesia. Yet, as Geertz himself points out (p. 323), "most of the larger nations of Europe grew out of a cultural heterogeneity hardly less marked," so wherein lies the crucial difference in their political histories? Surely not in the mere refusal to come to terms with diversity, as Geertz suggests, since these same European states displayed a similar reluctance (and some, such as Austria-Hungary, paid dearly for it; others may yet do so).

A good deal of the answer, I suspect, lies in the exogenous pressures which Indonesia and other ex-colonial countries have faced in confronting all their problems, including that of defining and managing the nation state itself. This is no new insight, least of all to Geertz himself, but we need to be reminded of it when we throw up our arms in the air at the seemingly irrational ways in which Indonesian leaders try to manipulate their sociocultural environment.

The great merit of these essays is to bring home to us how strong and deep-rooted the cultural patterns of Indonesia remain, and how they intrude into the most "modern" sectors of political life. They add substantial weight to the arguments of those who emphasize that the means to lasting and beneficial change in the new states lies not in an all-out war against tradition, but through a complex and selective adaptation of it. It cannot be said that Western policy makers, or the present Indonesian leaders who defer to their advice, have taken heed. Herein lies the grounds for the pessimism that infuses Geertz's conclusion; herein lies the unstated but pervasive lesson to be learned from a reading of these essays as a whole.

Trade Unions and Politics in Ceylon. By Robert N. Kearney. (Berkeley: University of California Press, 1971. Pp. 195. $10.00.)

The purpose of this book is to describe and categorize the political action and associations of trade unions in Sri Lanka (Ceylon). While the main focus of the study is on the interaction between labor organizations and political parties, the author also analyzes the functioning of Ceylonese trade unions in their capacity as bargaining agents for the organized labor force in Sri Lanka. Dealing primarily with post-1960 developments, the author refers on occasion to the background of earlier events.

Professor Kearney's study brings certain characteristics of Ceylonese trade unions into relief. There is first the prodigious growth in the number and membership of trade unions in Sri Lanka since 1947 when that country obtained independence. In 1948 the total membership of unions which submitted an annual report to the Commissioner of Labor was 158,178. Twenty years later, the reported membership of Ceylonese trade unions had grown to nearly one and a half million, approximately 10 per cent of the island's population. Two other characteristics of Ceylonese trade unions, however, have conspired to weaken the political potential of what on the surface has been an impressive record of growth. Most important is the fragmentation of the Ceylonese labor movement. In 1967, for example, 75 per cent of the 1,239 unions which filed an annual report had less than 250 members and of these only a fourth had a membership exceeding 50. This fragmentation, despite the organization of many of these unions into larger federations, has made it difficult for the working class in

Sri Lanka to act as an effective political bloc. Intense rivalry between labor organizations and among their leaders is another characteristic of Ceylonese trade unions. At every level of organization — the trade union, the federation, and the political party to which many trade unions are attached — both personal and political rivalry inhibits cooperative action.

These characteristics of Ceylonese trade unions, as well as the fact that Sri Lanka remains a predominantly agricultural country in which the majority of the gainfully employed are not unionized, could lead one to underestimate the political significance of trade unions in Sri Lanka. On the contrary, they are critically important for at least two reasons, according to Professor Kearney. In the first place, trade unions have organized workers in vital sectors of Sri Lanka's highly vulnerable economy. The tea estates, on which Sri Lanka depends heavily for foreign exchange, are dominated by powerful communalist trade unions of Indian Tamil workers. Public service personnel and workers in the port facilities have each been organized into unions whose leadership has been marked by competence and sophistication. Strikes by these unions can paralyze Sri Lanka's economy, and governments have had, on occasion, to invoke emergency measures. Furthermore, Ceylonese trade unions are highly politicized. Strikes have been used as a weapon with which to threaten or undermine governments, and governing parties have sought to form alignments with leaders of labor organizations in order, for one thing, to avoid politically-motivated strikes. This is especially true of the large number of unions which are affiliated with parties in Sri Lanka.

The degree to which trade unions are politically committed to parties forms the basis of Professor Kearney's typology of Ceylonese labor organizations. One type consists of party-sponsored trade unions. Established through the initiative of parties and maintaining close organizational links to the sponsor, this type of union is directly manipulated for political reasons. Organized into large federations, party-sponsored unions enroll, according to Kearney, from one fourth to one third of all organized employees in Sri Lanka. Party-oriented unions form a second type, differing from the first in that a party "cannot always depend on automatic acquiescence in the course of action it proposes" (p. 97). Originating independently of party initiative, this type of union is brought into an association with a party by the assumption of leadership in the union by party members. The third type of union described by Kearney is the politically uncommitted labor organization. It is distinguished by the fact that it avoids "the kind of close partisan association and predictable political behaviour which is typical of party-oriented unions" (p. 120).

Conceptually, Kearney's classification is a useful ordering device which may be applicable in the study of trade unions in the intensely political environments of developing states. I say this despite the analytical and empirical flaws that mar the author's otherwise well-conceived scheme. Kearney's classification of Ceylonese labor organizations falls short, partly because empirical support for his types is inadequate and partly because subjects are bent to fit the mold. Typologies of party-oriented and politically uncommitted unions, for example, are drawn from profiles of a few unions, readily accessible to the researcher, which the author describes in order to substantiate and illustrate the type. The reader is left unconvinced of the representative character of these unions, especially since the names, number, and membership of the labor organizations included in these types are not given. More serious is the fact that profiles of some unions used to exemplify types are distorted. The Ceylon Mercantile Union, which Kearney categorizes as party-oriented, was founded under the aegis of a party. While it is true that its leadership was assumed later by members of another party, the union has taken great pains to insure an identity separate from that of the party to which its leaders belong and to retain a nonpartisan posture regarding political questions.

A tendentious argumentation is also employed in regard to the unions whose profiles are drawn to illustrate politically uncommitted unions. Indian Tamil unions, which Kearney argues are typical of this category, are avowedly political entities, quasi-party in origin and behavior, and they have been consistently committed to the communalist and other interests of the community they represent. They function as much like parties as like unions.

Others of Kearney's examples are more relevant, and there is some basis for his categorization of Ceylonese trade unions. Had the whole of his scheme been more carefully considered and researched, his work would have been more theoretically useful.

CALVIN A. WOODWARD
University of New Brunswick, Canada

The Changing Pattern of Political Power in Iraq, 1958 to 1971. By Lorenzo Kent Kimball. (New York: Robert Speller & Sons, Publishers, Inc., 1972. Pp. ix, 246. $7.95.)

This is a survey of Iraqi politics. Following an initial section on power and nationalism, purportedly the central concepts, Professor Kimball proceeds to an essentially chronological account, emphasizing the period since the 1958 Revolution.

This is not a totally bad book. Most of the factual mistakes — like giving Syria as an example of a country in which a multiparty system has been "relatively successful" (p. 34) or saying that Iraq was the first independent Arab state (p. 57) — are peripheral to the author's main concern. With condensation and minor revisions, it might be turned into a readable popular account. The author usually writes relatively well.

But the book was apparently intended to be something more. According to the blurb on the jacket (perhaps not written by the author of the book), it is "an original contribution," and its heavy documentation gives it the form, but hardly the substance, of serious scholarship.

The account is generally superficial. To cite one example, analysis of the dynamics of the post-1968 regime is largely limited to standard biographical information on President Ahmad Hassan al-Bakr, described as "the acknowledged leader of the coup and the Government" (p. 144). Such a figure as Siddam Husayn al-Takriti — who, rather than President al-Bakr, has often been regarded as the most powerful person in the regime — is not even mentioned.

The book is padded with digressions into subjects that are only indirectly relevant, such as the Lebanese crisis of 1958 (pp. 88–89) and the Arab-Israeli War of 1967 (pp. 127–128). Long-winded official statements provide poor substitutes for analysis, and the appendices (pp. 185–239) are unnecessarily extensive.

Furthermore, the research is not thorough. Minimal references are made to Iraqi sources. Unwise use of sources is sometimes made; for example, an unconfirmed generalization, pejoratively worded, is made about the late President Abdul Salem Aref (p. 92), citing *Near East Report*, a hostile, partisan newsletter. Carelessness is shown in matters like using a book published in 1960 as a source for figures on oil production in 1962 (p. 67).

The analysis of power and nationalism — particularly the former — is generally well done (though unoriginal), but is essentially tacked on, with little application throughout the book. The author's claim (p. viii) that this is a study of the conflict between pan-Arabism and local nationalism — "using the struggle for power in Iraq as the prime example" — does not bear scrutiny. The occasional attempts to relate these concepts to Iraqi politics seem forced and artificial. Thus, at the end of his historical survey, the author reaches the pedestrian conclusion that "the struggle for power in Iraq began early in the history of the Islamic Empire" (p. 59).

Insofar as Kimball deals with conflicting concepts of nationalism, he consistently depreciates pan-Arabism. Whether or not one shares his feelings, the author fails to make a convincing case. One might reasonably conclude that state interests prevail over commitment to pan-Arabism, but to say, as Kimball does (p. 118), that Arab nationalism "does not play a significant role in the struggle for power" is to go dangerously far. Arab nationalism is also equated far too simplistically with Islamic sentiment. At one point, the book lists "being a Muslim" as a basic ingredient of the Arab identity (p. 76), ignoring the existence of non-Muslim Arabs, some of whom have been leading Arab nationalists.

In conclusion, this book is of virtually no value to specialists on Middle Eastern politics, although the general discussion of power will interest some political scientists. Both political scientists and general readers may find it a convenient short introduction to Iraq, but its value in this regard is marred by serious deficiencies.

GLENN PERRY

The Patterns of Mass Movements in Arab Revolutionary-Progressive States. By Enver M. Koury. (New York: Humanities Press, Inc., 1970. Pp. 308. $11.00.)

Koury's book deals with five "revolutionary-progressive" states: Algeria, Tunisia, Egypt, Syria and Iraq. Prior to World War II, some of these states (e.g., Algeria) were dominated directly by the colonial power, others (e.g., Egypt), indirectly through a local elite and a net of treaties and agreements. All of them are developing nations and thus share with other developing countries the problems of scarcity and the challenges of development. Unlike other developing nations, however, these states, after the ascendancy to power of revolutionary leaders, are undergoing rapid changes involv-

ing the transformation of their societies into a social order compatible with the objectives of their respective revolutions — industrialization and modernization. In order to achieve these objectives quickly, the revolutionary leaders have sought to "bypass the evolutionary process of change by short-cut solutions" (p. 14). Single parties, in the form of mass movements, have been formed to serve both as a social base of the revolution and as its agent of change and of political expression within the state. They have attained popularity and support mainly through promises to bridge the "is ought to be" gap in their societies.

In his analysis, Professor Koury uses Rex O. Hopper's four-stage model of the revolutionary process. The first stage is characterized by uncoordinated mass discontent and unrest. The conditions which give rise to this state stem both from the gap between aspirations and reality and from the recognition that the traditional systems will not be able to bridge this gap. In the second stage, discontent and unrest are transformed into organized forces; the intellectuals ("the great men of knowledge") assume an important role in the affairs of their respective countries and thus set the stage for the "men of revolutionary action" to initiate their activities. In this stage, the existing order is discredited. The third stage is typified by conflicts between traditional elites ("conservative" and "liberal") and new elites ("radical"). This conflict is expressed in uprisings and counter-uprisings in which the radical elites take over and dictatorial rule is established. The last stage is characterized by actions aimed at legalizing and stabilizing the revolutionary government through the recruitment of mass support and the establishment of single mass parties. In this stage, the men of revolutionary organization "exploit what the great men of knowledge first conceived and the men of revolutionary action then instituted" (p. 189), in order to organize the revolutionary mass movements with the aid of such tools as "mass psychology, propaganda, communication media, slogans and ideas" (p. 192).

Although the book represents a useful addition to the better literature on the contemporary Middle East, a few reservations are in order: The author rightly observes that the Arab revolutionary leaders "share and embody the frustrations and hopes of their followers" (p. 138). The explanation of these frustrations is, it seems to me, incomplete if it is limited to the social and economic planes, important as these are, to the neglect of the political. The humiliation suffered by the Arab countries in the Arab-Israel war of 1948 has left its mark on later developments in these countries. It is no accident that the initial coups d'état took place after the 1948 war and that their leaders (e.g., Zaim and Shishaky of Syria, Nasser of Egypt, and Qassem and Aref of Iraq) fought on Israeli fronts. The experience of these defeated army officers in the field revealed the impotency of their traditional societies in the face of a progressive and modern one. Consequently, these disillusioned officers posed a challenge to the established authority in their respective countries, which set the revolutionary process in motion.

In a study of this nature, extending over the broad geographic area from Algeria in the west to Iraq in the east, with all its cultural differences, generalizations are necessary in order to point out the general patterns. But some of the author's generalizations are not applicable in equal measure to all the Arab revolutionary-progressive states (for example, in the section on the struggle for power, Iraq is not discussed, nor is Syria, except for the period of its union with Egypt); other generalizations can be applied not only to those states but also to non-revolutionary Arab states (as in the section on the men of revolutionary organization). In the process of reviving national consciousness, leaders quite often refer to past national glories, whether those from the "distant past" or the "immediate past," in which the nation takes pride. This is true of all nations, especially those at a certain level of national development; it is certainly true of the Arab states whether or not they are included in the revolutionary category, e.g., Jordan.

In addition, the doubts raised by the author regarding the continuity of the single-party regime upon the death of the leader (pp. 258–9) have proved unjustified, at least in the case of Egypt. After Nasser's death, the powers of office were constitutionally transferred to Sadat. And finally, a clearer definition of such terms as "totalitarian government" (which is often confused with authoritarian government), "natural group," "functional group," etc., would have been beneficial.

Despite these shortcomings, the book's important contribution to the understanding of the contemporary Middle East will be appreciated by students of that area.

SUBHI ABU-GOSH
The Israel Institute of Applied Social Research, Jerusalem

Economic Development and the Reponse of Labor in Scandinavia: A Multi-Level Analysis. By William M. Lafferty. (Oslo: Universitets-forlaget, 1971. Pp. 360. NK 48.00.)

It is unfortunate that political scientists have tended to ignore the Scandinavian countries. Although they rank low in power and population, and are scarcely exotic, they do offer congenial testing conditions for cross-national comparisons. Sweden, Norway, and Denmark are rich in data almost to a fault, similar enough to make comparison inviting, yet sufficiently different to make it interesting.

One of the most prominent exceptions to this neglect of Scandinavia is the literature dealing with the relationship between industrialization and the rise of the strong labor movements typical of all three countries. The classical statement of that relationship has been expressed in what Lafferty refers to as the Bull-Galenson hypothesis, formulated originally in 1922 by the Norwegian historian Edvard Bull, Sr., and paralleled by the later work of Walter Galenson. To paraphrase the hypothesis: the tempo, timing and intensity of a country's industrialization has been the most important factor in conditioning the character of its labor movement. The more sudden and rapid the industrialization, the more radical the labor response was likely to be, which explains why the Norwegian Labor Party was more radical than its counterparts in Denmark and Sweden.

While a number of other scholars, notably Lipset and Kornhauser, have incorporated the hypothesis in their work, it has never been subjected to any genuinely systematic empirical investigation. It is this task that Lafferty sets out to accomplish.

It is practically impossible to do justice to the scope and depth of his methodological apparatus in any brief account. He has drawn on a wide variety of American and Scandinavian thinkers: Mancur Olson, Lipset, Asbjørn Bjørnset, W. W. Rostow, Rokkan, Gösta Carlsson, and Ulf Torgersen, to mention but a few.

Lafferty's model is, in his own words, a "multi-level, ecologically-based data structure" (p. 22). It begins by developing, on the total-system level, a macrodynamic analysis of labor's response to industrialization (recast in the language of economic development) in the three countries, ranging from "highly abstractive comparison of total-system indicators to comparison of politico-historical context" (p. 24). There follows a contextual analysis of both individuals and group structures (the Labor Party and trade unions) within Norway. His third project, not yet completed, will involve an ecological-base analysis of labor's electoral response.

The study is unusually careful, methodical and sophisticated. It exemplifies as well as any comparable effort in recent years the enormous complexity that is inevitably involved when one attempts to subject a classical historical-descriptive hypothesis to systematic empirical treatment.

But it would be unfair to suggest that the book will appeal only to aficionados of methodological arcana, or that its findings are necessarily bound to the confines of Scandinavia. Although the conclusions are not drawn boldly, and while the general hypothesis seems to be confirmed, much evidence in the book suggests that factors other than economic development may have been every bit as influential in shaping the character of the working-class movement. Much of the analysis points instead to the importance of national-historical factors, e.g., the fact that Liberal-Labor cooperation was closer and more durable in Sweden and Denmark than it was in Norway. The presence of event-specific variables, such as the independence issue in Norway, clearly were important during the early period of the socialist movement. Structural considerations — e.g., the presence or absence of proportional representation, or the decentralized nature of Norwegian social structures in general — provide yet another variable of some potency. Finally, one can even move a half-step in the direction of the "great man" theory, for there were pronounced variations in the kind of leadership that emerged in the nascent socialist parties (e.g., Martin Tranmael in Norway, and the contrasting figure of Hjalmar Branting in Sweden).

The data generally confirm traditional views on the sequence of industrialization — first Denmark, then Sweden, and last of all, Norway. It does, however, cast some doubt on the assumption that the Norwegian experience was the most intense. There is furthermore considerable evidence that the putative Norwegian "radicalism" which earlier scholars had inferred from very limited evidence, may have been not much more than intraparty rhetoric.

After having followed an imposing series of intricate arguments in the book, the average reader could be left with a feeling of incompleteness, partly because this volume does not

purport to be more than a segment of the total project. But the sense of incompleteness may also be in some measure a product of the research strategy itself. The author spins such a fine and complicated methodological web that the conclusions tend to get lost in it. The findings are certainly substantial enough to merit greater delineation than they receive.

The study is skewed toward Norway, perhaps unavoidably since the Norwegian Labor Party is the deviant case, but the result is that the sections on Sweden and Denmark are not as detailed as they might have been. The book does not, for example, mention the highly important popular movements in Sweden at the turn of the century. An account of these would have added considerably to the discussion of the legitimation thresholds through which the various socialist movements passed (pp. 129–131).

But, minor flaws notwithstanding, the book will perform a real service for students of comparative politics if it does no more than expose the complexity of reality. Its major value is not that it generates new and seductive theories but that it demonstrates in a thoroughly professional way the marvelously subtle convolutions inherent in any systematic data-based examination of economic and political development.

Slums Are for People: The Barrio Magsaysay Pilot Project in Philippine Urban Community Development. By Aprodicio A. Laquian. (Honolulu, Hawaii: East-West Center Press, 1971. Pp. 245. $9.00.)

Those People: The Subculture of a Housing Project. By Colette Pétonnet. Trans. by Rita Smidt. (Westport, Conn.: Greenwood Press, Inc., 1973. Pp. 293. $11.50.)

Pétonnet and Laquian explore two different communities of the poor — different types in far different parts of the world, using different research techniques. Pétonnet writes a vivid, thorough description and analysis of an urban housing project in France, based on a classical ethnographic experience. Laquian reports the impact of a community development action research experiment in the Philippines, drawing generalizations from a survey of an important squatter community in Manila. Dr. Pétonnet, an anthropologist associated with the CNRS (National Center for Scientific Research) in Paris, worked as a solitary urban ethnographer. Dr. Laquian, who was deputy director of the Local Government Center in the College of Public Administration, University of the Philippines, organized a team of more than two dozen researchers and community workers seconded from seven different agencies. In both cases the research was carried out in 1966.

Both communities are new and both are labeled "transitional," which means that they live in the interstices of those public intentions, rationales, and fantasies called urban plans, shaped — in different ways — by the Great Hiatus between official starts and finishes, which holds the real meaning of urban space in our time.

The families of La Halle, waiting for years to get into the HLM moderate-rent public housing, dwelt precariously as "occupants," inferior to tenants because they lacked the protection of leases, remaining vulnerable to eviction for nonpayment of fees or for "misbehavior." They responded passively to their public fate as a stigmatized population stored in a sanitary container on the edge of the city by withdrawing into a social life of warm camaraderie within the project and into a personal life of extreme liberty, impatient of any restraint.

In Manila, however, fugitives from calamities of the village responded aggressively to the Great Hiatus of the metropolis. After the Tondo Foreshore was raised from the sea, and while government and business interests crept toward shaping the area for port facilities, the migrants who settled Barrio Magsaysay seized the gift of dawdles and wrangles at the top to rush, squat, and organize on government property, and to begin their struggle for title — a patient, intelligent, legal and political campaign to make secure their precarious tenure on ambiguous land.

In La Halle, one is struck by the extreme lack of political interests, the total absence of political organization, and the alienation from routine political processes. For any ordinary problem, whether it involved school, courts, or housing needs, the residents avoided intermediaries and insisted on going to the top — to the head of a ministry or even to the President of the Republic. They wrote long letters full of trust and hope to the chief of state. Questioning ten residents about this practice, the author learned that every one of them had written directly to General de Gaulle. It worked. After years of waiting, a letter to the General brought results in a matter of days.

In Barrio Magsaysay, one is impressed by the energy of political life, the extent of participation, the solidarity, and the sense of com-

nunity power. The people worked through obbies and pressure groups, stalked politicians, ısed every means the system offered, and managed to get some results. "The political strength of the squatters, arising from their unity and organization, had given them the legal right to stay where they were" (p. 74).

Feared as an explosive menace, more than 600,000 squatters lived in Manila at the time of the research, more than a third of the metropolitan population. Laquian argues that the virtues of the barrios outweigh their dangers. The research discloses that despite their deprivation of physical amenities, the residents felt comfortable socially, and 70 per cent of the people interviewed declared they were unwilling to move out of Barrio Magsaysay. The emotional warmth and security, mutual aid, and social controls in the communities not only help the migrant survive city life, but even transform him from a peasant to an urban man. Slums and squatter communities are shock absorbers, transitional way stations, halfway houses to modernity, and should be cultivated rather than demolished, says Laquian. Besides, since their demolition is impossible without immense trauma to the rest of society, the only solution is to rationalize slums, not to eliminate them. The author concludes with a plan for slum communities designed by the government and organized through community development programs. He moves from the experiment in Manila to offer some generalizations about "induced social change" in the developing nations.

Not everyone will share Laquian's faith in planning, his interest in changing motivations, or his scheme for engineering modal personalities. Some of his own information indicates that the admirable vitality in the barrio depends on a spontaneity that would scarcely survive governmental rationalization. He also suggests that community development programs harmonize the need of the community to develop its resources and the urge of the government to control the squatter settlements. Not everyone will swallow that claim. The book is warmed by the author's humane concern for the squatters, and it contains useful material that demolishes some stereotypes about barrio life. Most of it, however, reports quantitative data drawn from the survey, coming alive only in a few pages that describe real people and events, hinting at the dynamics of the community. Otherwise, the picture is static and dim. One wishes for observations of the barrio equal to Pétonnet's view of the project.

Pétonnet's study describes how heterogeneous people dumped under the same scorn—"We in La Halle" — hearing outsiders claim "those people are savages," create a warm community with common values, struggle with privations, experience space and time in a special way, go through stages of the life cycle, raise and endure their children, complain of loneliness, fight and fear each other, yet dwell together in considerable harmony. Europeans, Arabs, and Jews from North Africa, as well as people from metropolitan France and other parts of Europe grow more like each other and lose some of their ethnic differences. Moslems and Jews live side by side without hostility. It is an important book on milieux for the poor, because, believe it or not, no one else has published a thorough ethnography of a housing project. It rectifies stereotypes about project life and even leads one to speculate that some day public housing may be revealed as a great involuntary experiment with diversity. As W. F. Whyte recognizes in his Foreword to the translated edition, Pétonnet's work carries the inspiration for a new program of research — the comparative ethnography of social problems.

E. V. WALTER
University of Manchester, England

The Great Fear of 1789: Rural Panic in Revolutionary France. By Georges Lefebvre. Translated by Joan White. (New York: Pantheon Books, 1973. Pp. 234, $7.95.)

The Men of the First French Republic: Political Alignments in the National Convention of 1792. By Alison Patrick. (Baltimore, Md.: The Johns Hopkins University Press, 1972. Pp. 407. $15.00.)

Georges Lefebvre's *La Grande Peur de 1789* is now available in English for the first time since it was published more than forty years ago, in 1932. It is high time that Lefebvre's book became accessible to students and scholars who do not read French, so that they may become acquainted at first hand with this subtle and sometimes elusive classic by one of the greatest historians of the French Revolution.

Fear, panic, and rumors were widespread in France during the summer of 1789. Poverty, unemployment, and famine created general unrest. In certain sections of the country there were large-scale peasant revolts against the seignorial régime. Peasants feared for the safety of their crops as the harvest approached, and the vagrants who roamed the countryside, seeking work and begging for food, were often taken for brigands. Town and country feared

and suspected each other as riots occurring in one kind of place were blamed on machinations by the other.

But Lefebvre distinguishes between the generalized fear of brigands and the epidemic of local panics that appeared in revolutionary France and the characteristic phenomena which, in his view, constituted the Great Fear. This consisted of five or six currents of rumor and panic, which Lefebvre isolates and traces in great detail. They occurred almost simultaneously, between July 20 and August 6, 1789, and were distinctive in both their substance and in the speed with which they spread.

According to Lefebvre, the substance of the Great Fear seems to have differed from that of other panics in two ways. One was a heightened consciousness of danger. There had always been fear of vagrants, but the security measures taken by cities and towns in 1789 led the people in the countryside to believe that more vagrants than ever had scattered across the countryside. Vagrants had often been confused with brigands, and there had always been fear of brigands, in the sense that "the appearance of the brigands was possible and much dreaded." But during the Great Fear, people were convinced that the brigands were there; "they were there in the flesh, they could be both seen and heard" (p. 137). The other essential element of the Great Fear noted by Lefebvre is more fundamental. The vagrants-turned-brigands, whose presence was felt as real, were not ordinary brigands. They were somehow linked in the minds of the fearful with an aristocrats' plot against the Third Estate. Just as it was believed, quite correctly, that there was collusion between the aristocracy and foreign powers, encouraged by the *émigrés*, it was widely believed that the aristocrats had turned a kind of army of vagrants out into the countryside to injure the peasants and destroy their homes and crops. The Great Fear was not fear of brigands; it was fear of counter-revolution.

The other distinguishing characteristic of the Great Fear cited by Lefebvre was its movement. There were numerous localized panics in France, but the Great Fear traveled. In fact, Lefebvre tells us that it traveled at a speed of about four kilometers an hour (during the day). Each of the currents of the Great Fear appeared at a particular place on a given date and traveled elsewhere, along routes which Lefebvre charts in detail, carried sometimes by ordinary people, but more often by people of standing or the authorities themselves, who increased the panic by dutifully taking fanciful rumors seriously lest they themselves be accused of collusion with the plotting aristocrats. Fresh panics were set off en route, sometimes when peasants marching to the rescue were themselves taken for brigands. In one of the most fascinating historical accounts ever written, Lefebvre traces in detail the routes of the currents of fear, with the result that we learn, among other things, that a panic which started in Ruffec (in what is now Charente) on July 28 reached Lourdes, near the Spanish frontier, on August 6; that the Ruffec fear (which moved east and north, as well as south) met the Maine fear (which began somewhere west of Chartres) at the town of Loches (southeast of Tours); and that more currents of fear flowed into Millau (in what is now the Aveyron) than any other town.

The striking originality of this work, as George Rudé points out in his introduction, is that "rumor, panic and fear . . . are presented as a new and significant dimension in the historical process" (p. xiii). Perhaps paradoxically for a work with such a central theme, it is its passion for detail on a relatively narrow range of matters — the itineraries of the currents of fear — that most impresses. The linkages between the fear itself and other historical processes are less clearly presented. We can accept the proposition that the Great Fear both reflected and increased peasant opposition to the aristocracy, but other related questions go unanswered. We do not learn, for example, why the Great Fear appeared where it did but not elsewhere, why the Great Fear followed a peasant uprising only in the Mâconnais, but not in other areas of popular revolt, or why revolt followed the Great Fear only in the Dauphiné but not elsewhere.

The translation by Joan White is generally faithful, but there are some lapses. On p. 153 the word "often" in the original appears as "most often," with results that are somewhat puzzling in the light of later remarks, and on p. 155 the text does not include what Lefebvre himself said in the original version, that he assumed that the Great Fear was spontaneous and not deliberately contrived.

Alison Patrick's *The Men of the First Republic* is a carefully researched and detailed analysis of the composition and behavior of the French National Convention, which was elected in the fall of 1792 just after the downfall of the monarchy. The author, an Australian scholar, proceeds first by assigning the Deputies to three main political groups, the well-known Gironde, Mountain, and Plain, each of which she further divides into three subgroups.

Then, on the basis of the four roll-call votes taken during the trial of Louis XVI in January, 1793, and the two roll-call votes on the impeachment of Marat in April and the reinstatement of the Commission of Twelve in May, both of which could be expected to reveal deep political conflicts, Patrick examines the extent to which the groups previously established displayed consistent patterns of behavior. Later chapters examine the extent to which there appears to have been consistency between the political outlook of the departmental assemblies which elected the members of the Convention in September 1792 and that of the Deputies whom they elected, and the prior political experience, the age, and the occupational backgrounds of the Deputies.

Patrick produces a number of findings of considerable importance to ongoing debates about the character of political conflict during the period of the Convention and the distribution of attitudes among various political, social and economic groups. She finds, for example, that the Montagnard element in the Convention was quite large and received considerable support from the Plain, that the core of Montagnard strength came from the Deputies who had previously sat in the Legislative Assembly, that the Convention contained a consistently right-wing group, which Patrick classifies as a subgroup of the Plain, and that there is little evidence to support the notion that differing political attitudes at the time were related to differences in wealth or social status among the Deputies. The book contains a valuable account of the elections of 1792, and the author's painstaking research generally provides a wealth of information related to the Convention beyond those aspects mentioned briefly here.

The author, however, appears to be unfamiliar with methods of scaling or of index construction which could have been employed to great advantage in her analysis of the roll-call votes taken in the Convention. Data such as those presented in Table 5, which relates overall voting at the trial of Louis XVI to the initial classification of the Deputies into groups and subgroups, and in Table 23, which relates the overall voting to the prior political experience of the Deputies, could have been presented more economically if Patrick had given index scores to the Deputies and reported the appropriate means and standard deviations. Such scores could also have been employed to analyze the political behavior of the various age and occupational and other subgroups with which the author is concerned.

In his introduction to Lefebvre's *The Great Fear of 1789*, George Rudé suggests that the study of such phenomena as fear and panic requires that the traditional methods of history be enriched with statistical methods and computer analysis. The same may be said of the historical study of legislative behavior. But if Patrick has not done all that she might by way of analysis, she has supplied in meticulously detailed appendices such data as the complete list of Deputies, their ages and occupations, their votes on the six crucial roll-calls, and the groups and subgroups to which she assigned them. Moreover, this wealth of data, which others may reanalyze, is appended to a fine work of historical scholarship which enlightens us greatly about the Convention's place in revolutionary France.

Fifty Fighting Years: The South African Communist Party, 1921–1971. A. Lerumo. (London: Inkululeko Publications. 1971. Pp. 216. £1.25.)

Race and class are a volatile combination. The South African Communist Party since its founding in 1921 has struggled with little success to reconcile conflicting loyalties. This semi-official party history, by a veteran African journalist and party militant, was first published in the London journal, *African Communist*. It is a remarkably candid account accompanied by a useful collection of documents.

Lerumo's party history begins with a strained Marxian analysis of South African history, finding the pre-European societies in a state of primitive communism, and holding British imperialism and monopoly capitalism at least as responsible as Afrikaaner nationalism for subsequent oppression. Candor emerges with a frank denunciation of the Party's attempt in the 1920s to win white working-class support by implicitly endorsing anti-African demands such as racial job reservation. Checked by the Eighth Communist International in 1928, which ordered the Party to support an independent native republic, the Party suffered a disastrous period of extreme sectarianism, bureaucracy and loss of support. During the Depression according to Lerumo it spurned poor whites, many of whom turned to extreme right-wing Afrikaaner nationalism.

This Party history skips over the nightmarish 1939–1941 period. Always supine before Moscow, the South African Party switched overnight from a denunciation of World War II to enthusiastic support of South African entry after the German invasion of the USSR. Its

all-out support for the war won it new adherents and a modest measure of popularity, somewhat exaggerated by Lerumo. The dénouement came swiftly, however, as the newly elected Nationalist government pushed through the 1950 Suppression of Communism Act, outlawing the Party and swooping up hundreds of supporters.

The author cogently describes the Party's futile response to the governments' onslaught on its existence. The Central Committee, totally unprepared for underground activity, agreed to voluntarily dissolve the Party. Since then a new underground Party has emerged in South Africa with a legal wing in exile in London. Formally committed to armed revolutionary struggle and allied with the African National Congress (a body which the Party had fought for years as representing only the African bourgeoisie), the illegal party has yet to make much of a mark. It seems, however, judging from this book, to have arrived at a coherent, plausible explanation of its past and a new set of Marxian beliefs for the future.

Lerumo has succeeded in making the best possible case for the South African Communist Party by acknowledging its past errors and its limited role. His partisan account makes useful reading for students of South African politics, providing the documents and inside analyses on which a more balanced view of the Party can be based.

Political Participation in Modern Indonesia. Edited by R. William Liddle. (New Haven, Conn.: Yale University Southeast Asia Studies, 1973. Pp. 206. $7.50, paper.)

The five essays and the introduction contained in *Political Participation in Modern Indonesia* examine widely varied subjects but break new ground in our understanding of Indonesian politics—which is refreshing given the near-stagnation that Indonesian political studies appeared to have suffered in recent years.

From 1949 to 1962 a bloody rebellion took place in West Java, the homeland of the Sundanese, a people about whom little has yet appeared in scholarly print. This was a major rebellion whose purpose was to establish an Islamic state. From 1957 through 1961, *each year* approximately 1,000 Dar'ul Islam fighters were killed; 9,000 houses destroyed; while the Government side lost approximately 300 soldiers and 1,200 civilians.

Karl Jackson and Johannes Moeliono in their "Participation in Rebellion: The Dar'ul Islam in West Java" examine 19 villages that had followed very different courses: to fight for the DI, to resist it, and to swing back and forth between the two sides. Three villages, one from each group, are subject to intensive scrutiny.

"During the data analysis stage of the research, variables other than traditional authority were tested and found wanting. Systematic differences correlating positively with the political behavior of the villages were not found for variables such as religious values, income, education, mass-media exposure, and density of national symbolism. . . . The traditional linkages binding leader with followers within villages and the bonds that spread outward from the village leaders to the supravillage world were found to be the most powerful determinants of each village's political participation." (pp. 14–15)

To quote from the findings of the village that fought actively and at considerable cost for the DI: "The story of how this village became involved in the rebellion is similar to the sketches of decision making for the progovernment and the swing village. Although the results are very different, the elements constituting the process are the same. The set of long-term, highly personal linkages between advisor-advisee, teacher-pupil, and superior-subordinate are vested with traditional authority allowing the bapak (father) in each dyad to mobilize the anak buah (literally, children) for action by activating a personal loyalty bond" (p. 48). Within the essay is an excellent study of what is traditional authority within the Sundanese village.

Donald Emmerson's "Bureaucratic Alienation in Indonesia: The Director General's Dilemma" is an analysis of 1,859 answers to a competition in a 1968 issue of "Selecta," Indonesia's most popular weekly. The journal posed a problem for its readers: three candidates are proposed to the director general of a state organization. The position to be filled is an important one, and all three candidates are fully qualified, although in different ways, to fill the position. The public was asked: "Who in your view should be chosen to be installed as the leader of the corporation. . . . And what is your reason?"

The respondents most probably came from the intermediate strata of politically aware and socially mobilized Indonesians, but not from the elite or lower classes. The findings are complex, and the degree of alienation from and critical view of the bureaucracy is analyzed according to many variables. Emmerson notes

in his conclusion that the bureaucracy has redundant personnel, is ubiquitously corrupt, has a poverty-ridden reward structure, is ineffective in performance, and faces monumental tasks. "Bureaucratic alienation under such circumstances is rational. . . . It is based on reality. The problem for Indonesians is not how to adapt to that reality but how to change it" (p. 106).

Masjumi, the modernist Islamic political party, was banned by Sukarno in 1960. In February 1968 the new military regime refused to permit its reorganization, but did tolerate the formation of the Partai Muslimin Indonesia (Parmusi). Allan Samson, in "Religious Belief and Political Action in Indonesian Islamic Modernism," examines one of the basic causes of Parmusi's ineffectiveness. Parmusi, as Masjumi before it, contained three main religious factions, whose religious and political outlook he explores in depth: the fundamentalists, the reformists, and the accommodationists. Much research is still required on so-called Indonesian Islamic Modernism, and Samson does note of the reformists that their refusal to subject the basic doctrine of the Koran and Hadith to critical analysis "invites the question of just how modern Islamic modernism really is" (p. 130).

The Suharto regime intervened heavily to ensure accommodationist leadership for Parmusi — that is, in favor of those whose political philosophy is more pragmatic and indeed approaching secular thought, and who sought cooperation with non-Islamic organizations. This intervention necessarily led to the withdrawal of fundamentalist and reformist support, and the winning of a mere 5.4 per cent of the total vote in the 1971 general elections compared with Masjumi's 20.9 per cent in 1955. The government has subsequently forced Parmusi to fuse into a larger Moslem party.

Eliseo Rocamora's "Political Participation and the Party System: The PNI Example" lays to rest the traditionally held view of the PNI as the conservative party of civil servants and opportunist businessmen. He provides a careful study of the changing nature of the party from its founding in 1946 to October 1965. His greatest contribution concerns the PNI during the period of Guided Democracy, 1959–1965. The PNI not only expanded, but altered its character in a genuinely radical direction. The student, youth, and labor organizations grew rapidly, gained entry to the party's central leadership, and brought with them a radical ideology and organizational drive competing with those of the Communist Party. The younger leaders were from lower social strata and, increasingly, from the Outer Islands. But the PNI-left was, of course, politically eliminated by the subsequent military regime.

William Liddle provides both a brief Introduction and an essay on "Modernizing Indonesian Politics." In the Introduction he points to how little is known about politically important factors in Indonesia. *Within* Java these include the military, the bureaucracy, the extent and intensity of *aliran* loyalties, and the influence of traditional culture on decision-making processes and policy implementation; they include just about everything *outside* Java.

"Modernizing Indonesian Politics" is a study of the ideology and political thinking and maneuverings of the organizationally fragmented, secular, modernizing intellectuals in the period 1967–1969. Liddle argues that their utopia, a "modern" society, owed much to the egalitarian, industrialized, welfarist community envisioned by Sutan Sjahrir, although they jettisoned much of his Marxist content. Eager to rid Indonesia of its "backward" traditional society and culture, these intellectuals searched for formulae to ensure the victory of "modernists" in the upcoming national elections. Many tied themselves to the military regime and to the military-created GOLKAR which proceeded to sweep the farcical elections of 1971.

In Liddle's view, the secular modernists are as far out of touch with the realities of Indonesia as was the PSI (Indonesian Socialist Party) in the 1950's. They are urban, from higher social strata, and westernized. They are ignorant and suspicious (also fearful?) of the peasantry. Moreover, their mentors in the officer corps give no indication of sharing the same utopian dream.

In sum, *Political Participation in Modern Indonesia* opens to our understanding diverse but important aspects of recent Indonesian political history. And most of its authors do so in a way clearly sympathetic to the fate of the great mass of Indonesians who are poor and whose own voices have been largely silenced by military dictatorship.

DONALD HINDLEY
Brandeis University

China: Management of a Revolutionary Society. Edited by John M. H. Lindbeck. (Seattle: University of Washington Press, 1971. Pp. 391. Index. $12.50, cloth; $4.95, paper.)

It is unusual to find a symposium volume in which the papers are of uniformly high quality, and which are still timely after five years of

political typhoons. The nine immortals who contributed to this volume met in the summer of 1969 for a conference on Government in China, and their contributions were edited by the late John Lindbeck, who also wrote an introduction outlining the rationale of the book: to exemplify work by scholars as involved in the revolution in political science as they are with the Chinese revolution, and to merit attention for their use of "political science concepts, methods and data" (p. xi) as well as for their analysis of China. In a codicil, Gabriel Almond suggests that hitherto various hypotheses and theories of political development, for example, have not been thoroughly applied to China. "The principal reason for this failure grows out of the isolation of Chinese studies, and the slow penetration of notions such as these into the study of Chinese politics" (p. 382). He sees this study moving toward theoretical and methodological sophistication by the "importation" (p. 377) of conceptual tools, etc. from other branches of political, social, and behavioral science.

I can imagine some equally ethnocentric retorts, reminding us of the famous London newsboy's placard "fog in Channel — Continent isolated." Lindbeck puts it the other way: "Political science has now begun to accommodate the Chinese experience" (p. xi). A totally detached observer might see the fascination of this book as arising from its nature as a report by one set of "sorcerers" on the attempts of another set to redefine and justify their role. The first set has been defined by Benjamin Schwartz (more kindly than by Stan Andreski) as "a large assortment of CIA operatives, Pentagon strategists, professional Communist experts, games-theoreticians, political scientists and others" who seek to impose their ("Western") models and conceptual schemes on the infinitely varied flow of events; the other set is of course the elite of the PRC and especially Mao and his colleagues, who have been struggling for 25 years to keep their "politics in command" — with the techniques they learned during the 25 years before, and in another world.

Under the rubric "Authority and the Masses," Lucian Pye and Chalmers Johnson introduce some of the dilemmas of participation and authority which are exemplified in the case studies by Peter Schran on control and "self-reliance" in economic management, by Victor Li on the two models of a legal system, and by Donald Munro on the two-line struggle in Education. Michel Oksenberg reveals the nuts and bolts of top-level policy making under Mao, 1949–68; Frederick Teiwes marshals a mass of statistical data to clarify provincial politics and the key issue of central vs local power, which recurs throughout the book. He shows that in the provinces and in public, local leaders are the arm of the Center — but in Peking they may become spokesmen of their constituency (p. 137). Donald Klein dissects a representative bureaucratic organism, the Foreign Affairs *Hsi-t'ung,* and Ellis Joffe describes the restructuring of the Army under Lin Piao which prepared its intervention in the politics of the Cultural Revolution and the instructive events of Fall 1971. His narrative illustrates the continuing relevance of Pye's observation (p. 14) that in spite of its ideological dressing, the traditional Chinese system was ultimately dependent on military power; and this, as Ping-ti Ho points out, has largely determined its authoritarian character. While the purely military or professional viewpoint treats ideological dressing (political work) as "guaranteeing the fulfillment of concrete jobs," the generalist medicine men naturally argue that politics must guarantee their leadership — Party leadership — over the Army and "exercise the commanding and leading function" (p. 373).

Relating traditional forms of social participation to conditions preceding the victory of the Communists and their initial success in mass mobilization, Pye notes that the behavior of Chinese groups does not fit Western theories of mass politics; they did not make demands on, or compete to influence, the formal structure of government. Their members were subjects, not citizens. Johnson recalls Weberian and other theories of authority and traces the Mao regime's shifts in justifying its power: as leader of national liberation, as a development dictatorship, and by an ideology of personal authority — the Mao cult. One should now add the revival of Legalism. What emerges from Pye and Johnson is the slipperiness of our Latin words applied to Chinese ambiguities: participation slides easily into involvement and involuntary commitment, as described by Mu Fu-sheng and Bao Juo-wang. Authority need not depend so much on a "belief system" which legitimizes, as on a justifying emergency ("there's a war on!") or politics of resource reallocation (I'm in charge to see you all get your watery soup). K'ang Yu-wei put it succinctly in 1902: The suffering from universal autocratic rule will be less than the suffering from war and chaos caused by the existence of "boundaries" between States, families and so on. Like the refugees in the *Romance of the*

Three Kingdoms" and the People in Mao's essay on the correct handling of contradictions, our cultural ancestors too welcomed a Caesar and what Richard Falk calls the "Imperial solution" to a time of chaos. But robbing Peter to feed Paul also requires force, even if you call it building socialism (Oksenberg, p. 113). The role of arbiter between resource-hungry bureaucracies and social groups may justify a policy of divide and rule, but it also creates a tension between the ruler's image as Protector of the Poor and his job as top bureaucrat. K'ang, again, disarmingly illustrates the dilemma when he suggests that his cadres, though enjoying suitable emoluments, will all live and look like everyone else, "to show complete equality." (Ta T'ung Shu, tr. L. G. Thompson, Allen & Unwin, London 1958, p. 220.)

The related problems of "self-reliance" and "egalitarianism" vs. centralized control and élitism are so clearly illustrated in Li on Law, Schran on Management and Munro on Education that the ambiguities in these concepts also appear; reliance on the masses, *tzu-li keng-sheng* and decentralization slide into the attitude noted by Lord Macartney in the eighteenth century — that any technical problem can be solved by "putting more coolies on it" — and egalitarianism slides into the suppression of what J.-J. Rousseau called "partial societies," intermediate between the sole embodiment of the general will and the marching millions. This is why, as Pye notes, use of "mass movements" and group life to achieve wealth and power for the state may have institutionalized them as an alternative to, rather than powerhouse of, development — and led to privatisation rather than participation in the normal meaning. If Confucius wanted gentlemen but got players, perhaps Mao wanted little generals, and got massive choreography. In practice, the physical limitations on control and planning of the economy led to handling of routine mainly by lower levels and planning of expansion by higher levels; the difficulties of imposing a Soviet-style external model of law led to handling of routine, minor deviancy informally and prophylactically by group pressure — the internal model. The conflicting requirements of selecting trained manpower for industry and defence of the borders *and* cementing the worker-peasant alliance on the home front by limiting social polarization led to ambiguous formulas for education, such as the combination of work and study, interpreted as cover for a two-stream elitist system by the "'Liu Shao-ch'i revisionists" and as a ladder for the underprivileged by the motley forces of the Cultural Revolution. As Munro pertinently argues, in the struggle between these two lines there was a good deal of sense on both sides. The ultimate dilemma is that the blend of initiative and discipline into which Mao tries to harmonize the irreconcilables is characteristic of an army; and the contradictions which the official media now blame on the persistence of the bourgeois State apparatus and of the collectively-owned rural sector, wage differentials, etc. cannot be resolved until the elimination of the dangers arising from the existence of other States; notably the USSR.

IAN W.A.C. ADIE
The University of New South Wales

National Liberation: Revolution in the Third World. Edited by Norman Miller and Roderick Aya. (New York: The Free Press, 1971. Pp. 307. $7.50, cloth; $3.95, paper.)

National Liberation Fronts, 1960–1970. Edited by Donald C. Hodges and Robert E. A. Shanab. (New York: William Morrow and Co., 1972. Pp. 350. $8.95, cloth; $2.95, paper.)

The comparative study of revolution is a tricky business. "Revolution" can be ethnic, national, transnational, international, and can be defined in terms of various thresholds of violence and change. The possibility of even more imprecision is introduced in the subfield, "national liberation." Does the term refer to the removal of foreign occupation troops, the psychological uplifting of a people? Or is it a signal, a code word, for something entirely different, the establishment of a preferred type of ideological rule in the interests of certain powers, regardless of the form of the struggle that ensued for the achievement of power by a given group? All these questions must be posed in considering the present volumes inasmuch as the term is used for everything from "personal" liberation (if within the United States) to the struggle of one faction, incredibly, in a *civil* war.

Miller and Aya's study is a useful, if odd, combination of analytical attempts to disentangle some of the confusions existing in thought about the "revolutionary situation," and one-sided or polemical attacks on, primarily, the United States. Manfred Halpern tries to understand "incoherence" in the modern world, and sees clearly that the various types of revolutions are neither primarily plots emanating from "international communism" nor necessarily the result of unmitigated West-

ern perfidy. The Guevaras on one side and the Rostows on the other, he argues, "have become mere tacticians, separating violence from political transformation except in the realm of myth" (p. 18). The neglected revolution — of modernization — "is not a peculiar burden carried temporarily by the underdeveloped, but rather history's first common, world-wide revolution," where most of the breaking of traditional connections is "unintended and uncontrolled" (p. 19).

In contrast, consider C. L. R. James's fascinating account of what he terms the revolution in the Gold Coast. "The people of the Gold Coast could count on no direct support from anywhere" (p. 102), he writes, as if a century of anticolonial agitation in Britain, the active work of Clement Attlee's Labour government, the continuing struggle of such people as Fenner Brockway (as he then was), and organizations like the Fabian Society, were for naught. James asserts that, were Ghana to break into civil war, "British imperialism — disguising itself in the mantle of the United Nations — will go in again to protect British life and British property" (p. 104). Such theses must be established to prove his central assertion, that it was the "people," in some inchoate but pertinent sense of the term, who had "liberated" the Gold Coast, not the British, and certainly not the educated elite of the colony. C. L. R. James is in fact one of the last of the "old pan-Africanists," the group that gathered around George Padmore in London, organized the 1945 pan-African conference in Manchester, and championed Kwame Nkrumah. Read as a primary source, for understanding of that particular group, this essay is invaluable to the political scientist; but it is not social science.

Some of the essays combine analysis and polemics, for example, Mr. Eqbal Ahmad's insightful essay on revolutionary warfare and counterinsurgency. Mr. Ahmad scores a number of points on the counter-revolutionaries of the 1960s, but is so one-sided as to lack credibility. When he states that it is "probably impossible for counterinsurgency experts to perceive the truth, for doing so entails admitting a revolution's legitimacy and their own side's lack of it" (p. 184), he is noting that his mind is closed to the many instances where insurgencies lacked wide popular support, as was the case in the Philippines (on which he gets his facts wrong in any case (p. 148).

Quotes out of context, where an unlikely purpose is served, also occur. Mr. Ahmad is convinced that "Western liberalism has been concerned essentially with procedural freedoms while neglecting substantive ones." Sir Robert Thompson, thus, "has a fundamentally bureaucratic view of the problem" of insurgencies, a conclusion derived from Sir Robert's assertion that the bias of his quoted book, " 'is heavily weighted on the administrative and other aspects of an insurgency' " (p. 176), as if administrative capacity is not central to the establishment of equity and fairness in governance.

If in this first volume some of the writers are distressed at America's alleged inability to perceive the realities of popular revolutions, in the other volume, that of Hodges and Shanab, no such concern is evinced, since such an ability is not expected. "National liberation" does not mean, in the popular sense, the unshackling of a people: it is rather a codeword for a movement whose *ends* (if not whose immediate interests) coincide with those of one or the other international Communist power. "National liberation" is no longer, for example, the "democratic struggle against the survivals of feudalism" as it was prior to 1917. From that date a second wave began, under "the influence of the October Revolution," and it was directed against "not only foreign imperialist domination, but also native oligarchies." Likewise, nationalism in the Third World "has thus increasingly merged with communism . . . it is now part of the main antagonism of our times — the struggle between capitalism and socialism" (p. 29). We learn that "virtually the entire world is up in arms against U.S. efforts to dominate the world economically and politically, if not always militarily. . . . If the past half-century is any indication of the future, then we may expect the continued mushrooming of national liberation fronts and a steady contraction of capitalist influence in the Third World" (p. 7). The changes in Eastern Europe in the late 1940s by Communist parties are more indicative of what the authors mean by liberation (p. 29) than what might otherwise be taken to be a classic instance, the expulsion of Nazi troops in 1945. Thus the "liberators" of Thailand are the Communist guerrilla movements which have operated actively in the kingdom's extremities since 1965 (without however having attracted a popular base).

The kind of double-think that such a frame of mind necessitates produces many euphemisms. King Hussain's devastating success against the Palestine guerrillas in 1971 is a situation in which the government "tried to restrict the activities of the guerrillas" (p. 102). That which is permitted in the unedited contributions by "revolutionary leaders" is often equally interesting. We learn from the president

of the People's Republic of the Congo that "regionalism and tribalism appear in Black Africa with colonialism. Before that they did not exist" (p. 203).

"National liberation" also encompasses the struggles of the "blacks, Puerto Ricans, Chicanos, and American Indians" (p. 8). Puerto Ricans, indeed, rank fifth, in numbers, of the world's "subject peoples" (p. 317), after the Quebecois, and the Portuguese, South Africans, and American blacks. Apparently the persecuted minorities in numerous Third- (or Fourth-) World states (what are left of the Hutu in Burundi, for example) do not count; nor apparently, do whole nations whose independence was lost (for example the Baltic and Turkic Central Asian states) or whole peoples, among whom the anticolonial revolution has yet to be permitted to develop (despite Lenin's promise, before and after his assumption of power, to grant the right of "secession" to them).

If the first volume suffers from being a mixture of the naive and analytical, the second suffers, from a scholarly point of view, from a lack of analytical organization. Schematically the book is organized geographically, around regions, with sections combining interviews with favorite guerrilla leaders, selections from classic studies, and exhortations by hopeful leaders eager to proclaim the established government a fraud. But the book's editors are not attempting to make a contribution to the comparative study of revolution. They are trying to foster a particular kind of revolution. Beneath the sheep's clothing of what appears to be a serious study of an important topic, is something about which it might be appropriate to cry wolf. What Morris Janowitz said of guerrilla warfare in its relation to the examination of international relations applies here, namely that "the consequences of guerrilla warfare are a study area in which the assertions of ideologists and advocates serve as substitutes for effective analysis of realities and limitations" (Morris Janowitz, "Toward a Redefinition of Military Strategy in International Relations," *World Politics*, XXVI [July 1974], 478).

W. Scott Thompson
The Fletcher School of Law and Diplomacy

Politics in North Africa: Algeria, Morocco, and Tunisia. By Clement Henry Moore. (Boston, Mass.: Little, Brown and Co., 1970. Pp. 360. $4.95, paper.)

This fine study was published long ago, but has stood the test of time very well and still today deserves a review, however long overdue. Although it forms a part of the well-known Little, Brown series of texts in comparative politics, it is far more than a textbook: it is an admirable theoretical essay and a generally very successful application of the modern tradition of structural-functional analysis to the study of the North African states. It will probably be of greatest use to readers who already know a good deal about North African history and society and to those who already are familiar with the standard literature of the past two decades on comparative political change.

Much of Moore's concern is to establish a genuinely comparative frame of analysis, something surprisingly rare among scholars in the comparative field. He seeks to show how the differing historical circumstances of the three countries—notably, their various "colonial dialectics" with France—have left each of them with its own pattern of institutional capacities for response to social challenges. Thus, while the fundamentals of ecology, social structure, and culture are quite homogeneous in North Africa, the politics of the three states are each highly distinctive.

Professor Moore, in his own independent way, is very much an heir to the tradition of modern comparative theory established by the likes of Easton, Almond, Deutsch, and Huntington, in his preoccupation with the differentiation and interplay of inputs and outputs and in his efforts to gauge the mechanisms of stability in each political system. His membership in this tradition leads him naturally to share in its main virtues and problems. In North Africa, where each of the regimes has now lasted a very long time by contemporary world standards and, moreover, seems acutely conscious of the requisites of survival, it is instructive to learn in some detail from Moore how the art of survival is practiced in each instance and what the general rules of policy are that it imposes on each ruler. Bourguiba in Tunisia, for instance, with his strong Destourian Socialist Party and commitment to modernization, was pretty much impelled during the first dozen years of independence to keep seeking opportunities to expand his regime's impact on the wider population, while King Hassan of Morocco has sought to keep it to a minimum and Boumedienne in Algeria has been highly selective.

It is likewise useful to follow Moore's tracing of the varying capabilities of the three governments in the "extractive," "regulatory," "distributive," and "symbolic" realms (e.g., respectively, tax-collections, reform, social

services, propaganda), and the relationship of their performances to the measure of support to be had from their narrow or extended "stability groups" and "core combinations" (terms which he has borrowed from Ilchman and Uphoff). With the aid of such concepts, plus an encyclopedic store of information, Moore is able to explain in systematic fashion how King Hassan's search for widespread but scattered, and competitive, elements of support in the society (his "stability group," i.e., all those whose more or less passive support provides the basis of his legitimacy) has meant that his "core combination" of active collaborators is less close-knit and reliable than those of Boumedienne and Bourguiba. Boumedienne cultivates an extended stability group so little, and relies on the support of a homogeneous inner circle so heavily, that he is all the more free to make unfettered rational choices in economic policy, such as the heavy priority given to industrialization at the expense of agriculture, employment, and consumption. Thus Algeria is by no means the mobilization regime it is cracked up to be.

On the other hand, perhaps Moore's preoccupation with mechanisms of equilibrium, however much it may be shared by the North African political actors themselves, gives us a picture that is a little too narrow and a little too tidy. Is the process of self-maintenance necessarily the most significant thing worth exploring in the political systems of North Africa? And how do we gear our understanding of these countries to such important but unpredictable events as a senile president's clinging to office in Tunisia, the windfall for national budgets of oil and phosphate price rises, or the spectacularly futile attempts of conservative Moroccan army officers to eliminate their conservative king?

Mixed Enterprise: A Developmental Perspective. By Lloyd D. Musolf. (Lexington, Mass.: D. C. Heath and Company, 1972. Pp. 172. $10.00.)

How do governments make use of the various possible relationships between government and private enterprise for economic and consequently social and political development? This constitutes an important problem area, and the author breaks new ground in surveying it. In between purely public and private enterprises a significant variety exists of combinations of industrial relationships relevant for economic development planning. The concept "mixed enterprise" is reserved for domestic, intersectoral firms whose ownership is shared between the public and private sector. It is thus distinguished from multinational and even joint enterprises in which the sharing of ownership may be absent.

Professor Musolf usefully points out that economic development involves a choice about the public/private-sector mix, and his survey of strategies in nine countries can provide itself a measure of economic development philosophies. Furthermore, in exploring the impact of mixed enterprise on economic development, he examines the relationship between mixed enterprises and a number of important political questions such as: Can an influence equilibrium between the public and private partners be maintained once established? (He thinks not.) Will the government sector dominate the private sector in less-developed countries? (He thinks so.) And, what happens to mixed enterprises over time in the development process? (He thinks they probably decline.) In order to address these issues the author surveys the basic relationships between government and the economy—why and how is government interested in economic planning and commercial ventures? How is public enterprise related to national development?

The author's general survey of government enterprises is an important contribution, and the author well describes the current varieties of relationships between public enterprises and economic development planning. The remainder of the volume is devoted to surveys of mixed enterprise strategies in a number of countries. We learn, for example, that nonideological economic development goals dominated the history of mixed enterprise. Mixed enterprise emerged inductively from failures and weaknesses in private enterprise. The Japanese, especially, were successful in forming enterprises and transferring them to the private sector. The Pakistanis have not been as successful in a similar effort, and India, for ideological reasons, has not allowed private participation in government-initiated enterprises even when such participation has been urged. Israel, Taiwan, and Mexico have been more "successful" at using mixed enterprise in their national economic planning, while mixed enterprise has not been used much in the United States until very recently.

The main problem with the volume is the absence of a structuring principle, a set of theoretical criteria for choosing the countries selected for the survey. At a minimum, to test

the impact of public and mixed enterprise on national development, it would be useful to select countries at similar levels of "development," both with and without mixed enterprise. Essentially, the volume is descriptive and introductory. My central quarrel is with the author's treatment of development. Surely, the author could have gone beyond vaguely equating industry and finance with modernization. And exactly what kinds of basic questions can we address through learning about the public/private sector? The author alludes to the success of the "Japanese pattern" of beginning enterprises and then transferring them to the private sector. But unless the author controls for a host of exogenous dimensions, e.g., the degree of political institutionalization, the rate and sequence of change in the Japanese case, what do we learn?

Despite these reservations I believe that the author has provided a service by addressing an important set of issues in a development context.

Rural Thai Government: The Politics of the Budgetary Process. By Clark D. Neher. (DeKalb, Ill.: Center for Southeast Asian Studies, Northern Illinois University, 1972. Pp. 63. $3.00 paper.)

The budgetary processes of local government institutions in Thailand have received little attention to date, and this brief monograph represents a useful attempt to fill a gap in an important aspect of Thai government and politics. Based on his research in Chiang Mai province of northern Thailand, Professor Neher presents conclusions on the overall structure of local government organizations and then illustrates the process of budgetary allocation for local development projects through case studies in two communes (*tambon*) of two different districts of this province.

The monograph contains a review of the formal structure of local administration. Neher concentrates on techniques by which the commune council (*sapha tambon*) allocated revenues made available to it through local land taxes. Failure to mention the various roles of the Village and Tambon Development Committees sponsored (and supported financially) by the Community Development Department is surprising; these committees also allocate financial resources (from the CD budget) for local development projects, and often have an over-lapping membership with the commune council.

Greater difficulties arise from Professor Neher's emphasis on the "local government budget." The impact of the budgetary process on the residents of rural Thailand is determined far more by decisions on how to allocate central government revenues within any particular province or district than by decisions of the commune council on allocation of the relatively minuscule amount of money at their disposal during the period under study. Analysis of budgetary politics needs to include the vastly larger amount of construction project activity under way through the various agencies, and budgets, of the central government: roads, wells, irrigation facilities, all the rest. A detailed focus on allocation of 11,700 baht (about $585) for one year by the council in one commune fails to supply the necessary perspective.

Nevertheless, Neher's descriptions of the council meetings in which project priorities for the coming year are determined provides useful insights into rural Thai politics: the relative roles of the District Officer, local politicos, and ordinary villagers; the degree of lobbying and particularistic interest-group pressures; the extent of information available to participants; villager expectations for certain kinds of responses and results when dealing with officials of the central government. As political participation increases in rural Thailand, which has happened in many areas since overthrow of the nation's military rulers in October 1973, these issues gain in relevance to the broader study of Thai politics.

Professor Neher's study of rural budgetary procedures and the role of commune councils became more important as a result of allocation decisions made in the spring of 1975 by the newly elected civilian coalition government headed by M. R. Kukrit Pramoj. In order to gain additional support in the House of Representatives and accelerate political decentralization, the new Prime Minister announced a special fund of $125 million (2.5 billion baht) to be made available for rural development projects—$25,000 (500,000 baht) for each *tambon*. These monies are being allocated by commune councils such as those studied by Neher; neither the District Officer nor others in the central government's bureaucracy can override the decisions of this local government institution. This is infinitely more money than these rural leaders have ever before had available on which to exercise their budgetary and political priorities; and the sum was increased to 3.5 billion baht in the 1976 national budget. This monograph, by

providing insights into how these institutions allocated some 10,000 baht per year, gives us a better basis for understanding the problems and potential in allocating fifty times this amount under Kukrit's innovative and controversial new effort.

Socialist, Anti-Semite, and Jew: German Social Democracy Confronts the Problem of Anti-Semitism, 1918–1933. By Donald L. Niewyk. (Baton Rouge: Louisiana State University Press, 1971. Pp. x, 254. $8.95.)

The extent to which anti-Semitism permeated various segments of German society in the nineteenth and twentieth centuries has proved to be an extremely complex question and may be impossible to answer definitely. The increasing intensity with which anti-Semitic policies were pursued by the National Socialist regime after 1933, culminating in the murder of at least five million European Jews, left the understandable but unproved impression that all Germans either hated Jews or at best were indifferent to their past persecutions and contemporary suffering. It is this larger problem that has motivated Donald Niewyk to address himself to the more manageable task of describing the "attitudes and actions" of German Social Democrats toward Jews and anti-Semitism during the years of the Weimar Republic. If the implications of this study hold up, then a very substantial segment of German society was free of anti-Semitic prejudices.

Two themes are central to Niewyk's work. The first is that the Social Democratic party consistently and vigorously opposed Judeophobia and promoted friendly relations with the Jewish community. Although he does present evidence of a few anti-Semitic statements by socialists, Niewyk concludes emphatically that "the marginal infiltration of anti-Jewish opinions among individual Social Democrats remained almost unmeasurable" (p. 210). This point is made repeatedly as Niewyk documents how Social Democrats responded to anti-Semitic propaganda and other attacks on Jews. The second theme is more interpretive. While Social Democrats rejected anti-Semitism, Niewyk argues that they underestimated its seriousness and significance. They failed to understand that anti-Semites did in fact hate Jews as Jews. The Social Democratic misunderstanding rested on an erroneous explanation — the "plot theory" — that maintained that Jews were "merely convenient scapegoats" and that the actual goal of anti-Semites was to destroy the Weimar Republic and the Social Democratic Party. Although a few Social Democrats leaned toward other theories, for example, psychological interpretations of Judeophobia, the "plot theory" was never dropped, and, the author concludes, it blinded socialists from seeing the genuine danger in anti-Semitism.

The central points have been made judiciously, but some aspects of the book are not entirely satisfying. As Niewyk himself admits, his evidence is not adequate to demonstrate that rank-and-file Social Democrats fully and always agreed with the party's denunciations and explanations of anti-Semitism. On this issue, the limits of Niewyk's narrow documentary approach are evident. He is too inclined to treat anti-Semitism chiefly in terms of doctrinal and policy statements and does too little to approach it as a multifaceted phenomenon involving a web of emotions that may be felt but not necessarily acted upon. The author hardly touches on the psychological complexities embedded in anti-Semitism. One longs for more analysis that differentiates kinds and levels of Judeophobia. On another matter, greater attention to attitudes found in the Communist party would have created a larger context for evaluating the opinions to which organized labor as a whole was exposed. Finally, since Social Democratic thinking on anti-Semitism and Jews did not change dramatically during the years of the Weimar Republic, there is a dulling sense of repetitiousness as the story proceeds. This sense is compounded by an organizational scheme that is itself repetitious. But Niewyk's study is, within its range, sound and reliable, offering a fine beginning for further exploration and refinements on Social Democratic sentiments on anti-Semitism.

Liberal America and the Third World: Political Development Ideas in Foreign Aid and Social Science. By Robert A. Packenham. (Princeton, N.J.: Princeton University Press, 1973. Pp. xxii, 395. $15.00.)

Robert Packenham epigrammatically summarizes as follows the key ideas of American "liberal myopia" as they have been applied to foreign aid and other interventionist policies since World War II: Change and Development Are Easy; All Good Things Go Together; Radicalism and Revolution Are Bad; Distributing Power Is More Important Than Accumulating Power. He then goes on to show us how these principles undergird both the *doctrines* of the

practitioners of foreign aid and the social science *theories* pertaining to political development. The author makes a good case that the best framework for understanding doctrines and theories of foreign assistance between 1947 and 1968 (and later?) is provided by writers like Louis Hartz, Daniel Boorstin, David Potter, Carl Degler, and others who have explicated this country's unique experience with the liberal tradition.

The shift of attention from Western Europe to the Third World did involve the astonishing assumption that relatively small economic inputs would produce enormous transformations. Somewhat dizzied by the successes of the Truman Doctrine and the Marshall Plan, we developed strategies of intervention elsewhere that were based on profoundly unrealistic notions of multiplier effects in economic aid programs. Furthermore, our commitment to such premises and to the assumptions the author describes were so strong, we were unable to interpret rapidly enough when our interventionist policies were doomed and equally unable to adapt when boomerang effects upset our own domestic equilibrium.

Often as not our policies encouraged abroad increases in instability, radicalism and violence. Finding our impulses to build democratic mirror images frustrated, we tended to support any regime, however conservative or reactionary, that would at least spare us the additional frustration and fear produced by political instability and radical movements. This posture was as true of the Kennedy years as it was of the presidential policies that preceded and followed him. Rhetoric and preachments about democracy aside, the Kennedy administrative practice heavily confirmed that national security, anticommunism, and economic development were much higher-priority goals than the encouragement of democratic regimes. Our model of democracy was itself distressingly parochial, too often overstressing populistic norms, too uncritically wedded to the American liberal idea that checks, balances, decentralization, and other methods of distributing rather than accumulating or concentrating power were desirable.

As an example of this last point, Professor Packenham discusses the so-called Fraser Amendment which was incorporated as Title IX of the Foreign Assistance Act. Title IX represented the first time that explicit political goals were written into foreign assistance legislation. Packenham notes the amendment's emphasis on local government and political participation in voluntary associations and in local developmental schemes. Despite his personal experience in Washington, the author seems to have missed two critical aspects of the wording and intention of Title IX. First, the emphasis on local rather than national government and politics was designed to avoid trouble with congressmen (and perhaps national leaders abroad) who would not endorse overt language about our intentions to affect *national* government. It did not in this sense reflect one of the four liberal norms. Second, Title IX itself is a very good example of the influence (for better or worse) of academic theorists on those who make and try to implement public policy. As such its existence runs counter to what the author has to say about the impact of the theorists on the practitioners.

The description of the relationship between these two groups — the officials who make and apply doctrines and the professors who spin and try to sell theories — constitutes the most interesting, troublesome, and provocative aspect of this book. Packenham offers us an intriguing, somewhat contradictory interpretation of the relationship between the social scientists who were interested in political development and the officials who administered foreign aid for two decades. As theorists and as individuals, he says these scholars had little influence; indeed most of them (including the most luminous names in the academic firmament) were not well connected and were largely unknown in Washington (pp. 243–249). Whatever may have been going on in the academy (and Packenham finds astonishingly more intellectual agreement there than was or is the case), theories of political development were more ignored than utilized in our foreign policy. Furthermore, he says, "The theories not only *were not* used very much; they also *should not* have been used very much because they had little to offer policymakers and could not have improved policy a great deal even if they had been more widely employed" (p. 254).

I think Packenham is right, not only because (as many of us were saying in the very literature Packenham examines, or examines in part) the conceptual status of the political development literature is a highly parochial Tower of Babel. The so-called theories of political systems and development for the most part are not theories at all. These formulations are made at so great a level of abstraction as to put off any policy maker who, unlike some undergraduates, will quickly see the poverty of high-flown abstractions, cosmic classification schemes, and simplistic platitudes about government that often masquerade as policy ad-

vice. It is a pity that Packenham did not pay more attention to the differences among the social scientists whom he has too readily lumped together.

Packenham then says that these same academic elites *did* have an impact on policy makers, not so much as individuals but as representatives of organizations like Rand, Brookings, or the Council on Foreign Relations; as consultants, researchers, and conference organizers associated with a handful of universities headed by Harvard, MIT, and Yale and financed by the leading American foundations. That influence turns out to be, in the author's view, a sheer abdication of the responsibility of the social scientist. Rather than criticize and provide alternatives to leading policy doctrines, the social scientist supports them; rather than challenge what the policy maker does he endows these things with legitimacy. Far from suggesting conspiracy or even strong patterns of cooptation, Packenham notes that when social scientists and government officials see themselves as jointly involved in a common endeavor "the government does not need to coerce or buy off the social scientists in order to inhibit criticism." The liberal tradition blunts conflict by making these elites ideological bedfellows (p. 303).

Packenham goes on from here to weaken his own argument and indeed to erode away the generous and self-critical impulse that underlies the book itself. For example, he says (p. 306) that the social scientist should be neither a critic nor an advocate but should "search for truth." Yet this is part and parcel of the behavioral posture of some scholars that leads, as Packenham himself shows, to advocacy masquerading as scientific truth, and to a neglect and abandonment of the *critical* function which necessarily and always must have an underlying normative base. It seems to me well established in our theory if not in our practice of social science that a critical skepticism toward things as they are in society is essential.

The book's concluding pages are the most revealing. Having lamented the abstracted empiricism and the prescriptive arrogances he finds in the political development literature, the author defines political development as *"the will and capacity to cope with and to generate continuing transformation toward whichever values seem appropriate in the particular context"* (p. 338, italics in original). Appropriate to whom? Not specified. What values? Economic development, personal freedom, and socioeconomic justice. In that order? Well, that depends, because if there is too sharp a conflict with personal freedom, " . . . it might be necessary to accept lower rates of progress in economic development and socio-economic justice." (p. 339).

Which is exactly where many of us started before the intellectual homogeneity Packenham deplores began to break apart. Packenham himself seems to be showing us exactly how thick are the liberal blinders he has explored. He leaves us with the true but nevertheless scarcely reassuring direction that "ultimately, discovering satisfactory new paradigms and ideologies will probably require original research, a penetrating vision, a powerful creative thrust, rigor, logic, with a capacity for integration and synthesis" (p. 358).

Who wants to lead off?

Yugoslav Communism and the Macedonian Question. By Stephen E. Palmer, Jr. and Robert R. King. (Hamden, Conn.: The Shoe String Press [Archon Books] 1971. Pp. 247. $10.00.)

Tito's break with Stalin in 1948 brought with it many revelations of disputes that had been hidden behind the curtain of the proclaimed fraternal solidarity of the socialist regimes and communist parties. One such dispute, perhaps the most bitter, was the historic Macedonian question in modern Marxist dress. It had been a part of the secret history of the guerrilla activity in the Balkans during World War II, the subject of high-level negotiation and of decisions by the Comintern and by Stalin himself, and the central — and insoluble — element in plans for Balkan or South Slav federation debated endlessly by Communist leaders before, during, and after the war. The Macedonian question was used by the Communist powers against Greece at the time of the civil war in that country, but when the break with Tito came, Stalin chose to use it against Yugoslavia, and the Bulgarian leadership was only too glad to play that game. Tito fought back, the conflict over Macedonia came out into the open, and it has been there ever since.

Stephen Palmer is a Foreign Service Officer who served in Belgrade and in Sarajevo in the 1950s, the time when much of the new material on relations among the Communist regimes was being published. The hitherto secret history of the Macedonian question was brought to light in a series of publications of the Communist Party of Yugoslavia (KPJ),

notably in volume VII of *Istorijski Arhiv KPJ* and in the records of the first congress of the Communist Party of Macedonia held in 1949. Palmer during a year's leave at Indiana University made full use of this material to write a monograph for Western readers. His manuscript, a well-written study on a subject of both historical and contemporary significance, encountered massive indifference on the part of American commercial and academic publishing houses. Apparently Macedonia was a far-away land of which we knew, and needed to know, nothing. Over a decade later, with Robert R. King of Radio Free Europe as co-author, the book finally made its appearance in 1971. King, a first-rate scholar, has drawn on his own extensive knowledge of nationality questions in southeastern Europe to enlarge the study and bring it through the 1960s. It does not, however, go very deeply into the political battles and press campaigns of those later years, in which the Macedonian question has been a barometer of Yugoslav-Bulgarian and Yugoslav-Soviet relations.

The heart of the book is still Palmer's original portrayal of the strategy Tito developed to establish the primacy of his partisan movement in the Vardar valley during the war and to keep Macedonia within Yugoslavia thereafter. This book does not give the last word on this subject — new material has now appeared in the recently published memoirs of Vukmanović-Tempo, the executor of Tito's wartime strategy in Macedonia, and in the work of the Yugoslav journalist and historian, Slobodan Nešović, on Yugoslav-Bulgarian relations. Nevertheless it tells the story clearly, and with a rare understanding of the complex pattern of Communist politics superimposed on Balkan realities. The authors' long acquaintance with Communist methods and jargon and their understanding of the historical background of the Macedonian question (in so far as it can be comprehensible to anyone) serve them well.

They give full credit to the foresight of Tito and his colleagues in choosing to go all out in support of a "Macedonian nationality," and thus not only to atone for the Great Serb imperialism of Yugoslavia's past but also to undermine the Macedonian-Bulgarian sentiment which had seemed the only alternative. Although the Yugoslavs were not able to extend their Macedonian Republic to include ethnic brothers beyond the old frontiers of the Yugoslav state — and the fear that they would do so confirmed Greece and Bulgaria in their position that no people of Macedonian nationality existed on their side of the border — nevertheless, the creation of the Macedonian Republic as one of the six constituent republics of the federated Yugoslav state was a master stroke. How big a gamble it was, and perhaps still is, appears from the authors' frank conclusion that they do not know whether in fact a Macedonian nationality exists. The Communist leaders of Yugoslavia and of the Macedonian Republic have labored mightily to create that nationality, and their handling of internal and international questions over the past generations has given them the appearance of success.

In the present international configuration, things are likely to remain as they are. But if one considers some of the possibilities — say, a striking Soviet success in disrupting a post-Tito Yugoslavia or bringing it back within the fold, or a Soviet failure to hold Bulgaria as a subservient ally — then the old questions about Macedonia would rise again: conflict among the Balkan states over where the frontiers should be and where the Macedonians belong; or the age-old dream of Balkan federation in which a united Macedonia should have its place.

JOHN C. CAMPBELL
Council on Foreign Relations, New York

Modernizzazione e Sviluppo Politico. By Gianfranco Pasquino. (Bologna: Il Mulino, 1970. Pp. 304. Lire 4000.)

Militari e Potere in America Latina. By Gianfranco Pasquino. (Bologna: Il Mulino, 1974. Pp. 288. Lire 5000.)

In the first of these two books Professor Gianfranco Pasquino, of the Universities of Bologna and Florence, summarizes and interprets for the Italian reader the bulk of theoretical American literature on comparative politics. He makes an earnest attempt at integrating the various trends of thought in the "political development school," and spends a good deal of time finding out whether they are value free or not. The first three chapters, dedicated to this theme, are therefore quite ambitious but not very successful in fulfilling their aim. The remaining ones offer detailed and quite useful accounts of the thinking of Samuel Huntington, Gabriel Almond, and David Apter. For the Italian reader not yet prepared to cope with the texts themselves this work can be useful as a general introduction. For those already familiar it can provide a stimulating critique.

In his other book, on the military in Latin America, Pasquino comes to grips with a spe-

cific problem, and makes a more original contribution toward understanding it. The focus is theoretical and comparative, centered on four countries: Argentina, Peru, Chile, and Brazil. There is a chapter for each of these countries, covering the recent decades of its history. A good description of the facts is given, intertwined with theoretical interpretations and hypotheses of the middle range type. This combination, not very common and not at all easy to achieve, makes the book useful not only for courses on Latin America but also for others of a more general nature. The author's approach seems to be a mixture of the "political development theory" plus a sort of implicit neo-Marxism, reasonable in its exposition but quite radical in some of its conclusions. Secondary sources are used, not very deep in detailed information but solid enough in themselves.

The Argentine chapter is particularly successful in integrating propositional analysis with facts. The rapidity of socioeconomic changes and expansion of political participation are put in the forefront as causes of political decay in that country. Following Germani, Pasquino links the mobilization of internal migrants to the spread of *peronismo*. Pasquino analyzes the social origins of the Armed Forces while indicating that what happens to the military is not only a military problem, or a result of characteristics of that group, but also the outcome of tensions in other parts of society (p. 51).

The professionalization of the armed forces reappears in the various country studies and in the final theoretical summary as a central variable. As they become more technically competent, passing through advanced schools and seminars, the military acquire greater confidence in themselves and in their capacity to perform some of the tasks left undone by other social classes. The "permanent takeover" attitude spreads, as evidenced in Brazil and Peru, however contrasting the ideological orientations of their armed forces. Nor are they simple defenders of the interests of the oligarchy, or of the middle classes. A multitude of factors must be taken into account, making difficult though not impossible a theoretical analysis. The author clearly sees this, but occasionally he oversimplifies, as when, concluding his book, he states that military intervention can only "retard and aggravate sociopolitical problems, making a frontal confrontation with the lower classes almost inevitable" (p. 268).

The Peruvian chapter is to be commended for a clear analysis of the role of SINAMOS (National System to Support Social Mobilization) and the so-called industrial community. Both are seen as utilizing methods of mobilization and mass control, directed against the influence of grass-roots political movements. Of these there are two varieties: the old, established, and rather well-known APRA, and the new, potentially more dangerous radical left. The bitter hostility of the military to APRA is one of the classical enigmas of Peruvian politics. Pasquino reviews the evidence and various interpretations, though he does not seem to me to give appropriate consideration to the continued strength and vitality of the APRA. The fact that the APRA did not organize the rural masses actively enough must be seen not as evidence of its decayed vigor but as a direct result of its preponderance among the urban and plantation workers and lower middle classes. The weight of its union apparatus forced it to look after the demands of its members and supporters, shirking the more hazardous strategy of incorporating vast unorganized masses of Indians and peasants. Interestingly enough, it was Belaundismo in the 'sixties, based on higher social strata than Aprismo, which made inroads among those groups, and now it is among those very groups that the military regime can probably find a more receptive audience.

The Chilean chapter is more policy oriented, concerned with a strategy for the left. The effort is marred by several oversimplifications, as when it is taken for granted that "the whole progressive Latin American sociological school (has shown) the middle classes and other middle strata . . . to be incapable of an autonomous reforming function" (p. 157). The author criticizes the Communist parties of Chile and the rest of the continent for holding opposite views. His main recommendation is to give more importance to the organization of the "marginal" population (p. 158), and to keep in mind that toward the Armed Forces the only appropriate solution is the one adopted by the Bolivian revolution of 1952 and by Fidel Castro: they must be destroyed (p. 154).

In the Brazilian study we see again the marginal population given a central role as constituting a very serious danger to the system. This fact, not always accepted by political analysts, deserves closer attention, as it is certainly a time-bomb on the Brazilian political scene, making an adaptation to a pluralist political system more difficult. On the other hand, Pasquino's view about the unrepresentative nature of the pre-1964 political structure seems exaggerated. The parties of the Vargas

complex (Social Democrático and Trabalhista), together with their main opponent, the Uniao Democrática Nacional, are described as though they had been almost on the vanishing point, representing a smaller and smaller section of the electorate, based on statistics which show that the straight party vote was a diminishing percentage of the total (p. 172). This evidence may indicate the oscillation of alliances or the opportunism of leaders, but not the decay of parties. At this writing (several years after the book was finished) the party system of Brazil, however straitjacketed by the military government, has reappeared with rather high spirits and good health.

In an appendix the main theoretical points made in the text are summarized and developed, giving the gist of the author's argument, worth translating to make them available to the English reader.

TORCUATO S. DI TELLA
University of Belgrano, Buenos Aires

Public Expenditures in Communist and Capitalist Nations. By Frederic L. Pryor. (Homewood, Ill.: Richard D. Irwin, Inc., 1968. Pp. 543. $8.50.)

Public Expenditures in Communist and Capitalist Nations was commissioned by the Yale Economic Growth Center and the Center for Research on Conflict Resolution at the University of Michigan and published seven years ago. It is a thoroughly researched and copiously documented quantitative study in which Frederic Pryor addressed himself to three objectives: comparing market and centrally planned economies; extending the positive theory of public finance; and refocusing the study of comparative economic systems. Whether or not these laudable, though hardly modest, goals have been achieved, it is a book that deserves more attention than it has received, not least of all from political scientists. Pryor has selected a sample of fourteen nations in the Euro-American world and divided them into two groups of seven, those allocating resources through the market and those through central planning. Included in the former and ranked in descending order of per capita GNP are the USA, West Germany, Austria, Ireland, Italy, Greece, and Yugoslavia; and in the latter, Czechoslovakia, East Germany, USSR, Hungary, Poland, Romania, and Bulgaria. Using data from 1950 through 1962 for time-series comparisons and in 1956 and 1962 for cross-sectional comparisons, Professor Pryor relies largely on multivariate regression analysis to measure the influence of economic systems and the level of economic development on public consumption expenditures — most importantly for defense, welfare and health, and education, and, secondarily, for administration, internal security, nonmilitary security, and research and development. Whenever possible he analyzes the behavior of these expenditures with respect to substitution relations, centralization, stability, and incidence, the first of these having to do with the extent to which public expenditures become substitutes for private expenditures and the last with their impact on the distribution of income.

Pryor has taken on the statistical problems — inadequate and incomparable data sources; sticky aggregation difficulties; ambiguities in interpreting tests of statistical significance — that inhere in these ambitious intentions for good reasons. Specialists in comparative economic systems traditionally have been less concerned with making systematic comparisons of the performance of different types of economic systems than with the institutional, historical, and ideological circumstances that distinguished capitalist, communist, and fascist economies from one another. Following World War II, however, as the state became increasingly involved in the management of capitalist economies, and as communist economies flirted with market-type reforms in trying to overcome the micro-economic inefficiencies that were plaguing them, it appeared to many observers that these economies were converging. The so-called convergence thesis is no better grounded in systematic quantitative analysis than were the earlier views of the great "isms." Comparative observations like these need the data base that Pryor has set out to build. And he is certainly right in comparing a set of market economies and a set of centrally planned economies to minimize the force of idiosyncratic conditions in particular societies. Moreover, since governments establish and maintain the institutional and legal framework within which resources are allocated, they serve as a most appropriate focus for comparing economic systems.

In a book so thoroughly committed to a quantitative methodology and so carefully researched one expects that its conclusions will neither shatter our perceptions of, nor shock our values about, economic systems. *Public Expenditures in Communist and Capitalist Nations* is no *Time on the Cross,* that recent controversial exercise in cliometrics which appears to cast slavery in the ante-bellum American South in a more favorable light than hitherto. We learn that the economic system vari-

able is relatively unimportant in accounting for differences in public consumption expenditures and that ideological, customary, or political factors are becoming less important with the tempering of cold-war dogmatism. The level of economic development "plays a statistically significant role in the cross-section analysis . . . for only internal security, foreign aid, and research and development. For military, welfare, education and health expenditures, on the other hand, this *per capita* income variable has little explanatory power" (p. 287). Again, "For welfare expenditures and, to a lesser extent, health expenditures, there seems to be an upward limit to the public expenditures/GNP ratio, such that those nations with the lowest relative expenditures have the fastest increase in public consumption expenditures" (p. 291).

These all-too-brief examples of Pryor's conclusions are typical of his judicious and restrained approach to this vast comparative enterprise — a consequence, no doubt, of the sobering influence of quantitative data. In fact, he may have been overly cautious. At any rate he felt constrained to stand off from the evidence which supported the convergence thesis. "Indeed, in a great many more important respects the two economic systems are very different and, let me add without proof, are *not* becoming more similar" (p. 310 emphasis in text), a statement which suggests that even the most indefatigable researcher may sometimes feel oppressed by his numbers.

In conclusion, I should note that Pryor has placed most of the statistical data in a series of appendices which account for more than one-third of the book. This helps those readers who would have found the complete quantitative story dense and difficult to penetrate while concentrating the data base of the study for those who are as interested in quantitative methodology as in substantive conclusions. Unfortunately, the publishers have not been as considerate of the reader as Pryor has; there are an unconscionable number of typographical errors which certainly should have been caught by the editors. Finally, it is not clear why Pryor insists on calling all current government expenditures "public consumption." Surely expenditures on education or research and development represent investment rather than consumption.

KARL DE SCHWEINITZ, JR.

Northwestern University

Industrial Society in Communist China. By Barry M. Richman. (New York: Vintage Books, 1972. Pp. 968. $4.95, paper. Hardbound edition, 1969, $15.00.)

Barry Richman, Professor at the Graduate School of Business Administration, University of California, Los Angeles, went to China rather unexpectedly more than a decade ago and was able to gather detailed statistics on thirty-eight Chinese economic enterprises of all types. At the time, his data were unique and he hurried to publish them in a form that would be understandable to the general reader and yet would contribute to specialist knowledge of Mainland China's management and economic development. These form two of the purposes of the present volume. The author also desired to assess the Chinese experience by referring to his own general model of such processes and by comparison with his previous work on Indian and Soviet management. Finally, the author wanted to publish a volume on contemporary China that would serve as a guide to understanding that country as a whole, not merely its management practices.

After a decade, Richman's data are still invaluable because they fill a gap in the period just before the Cultural Revolution and complement the more extensive statistics compiled by many observers since. More important, the administrative situation and policy direction described in early 1966 is much more analogous to the post-Cultural Revolutionary present than to the intervening years of turbulence. Thus, far from being outdated by the quick march of events in China, this book continues to have relevance for the serious student of the People's Republic. If carefully mined, it contains a wealth of material useful for historical comparison in the author's fields of competence. Finally, the intervening decade has not been unkind to his more extensive analysis of such areas as education, social attitudes, and law in China.

But the original problems of the work, originally published in 1969, persist. One is that the author, like many others writing on China, attempts to do too much within one cover. It is impossible for him to fulfill the ambitious aims listed above without moving onto insecure factual grounds and without enlarging the book to a length that most readers will not wish to tackle. It would possibly have been better if Richman had published his notebook of economic and management data — that, after all, is the enduring legacy of his visit — and refrained from the temptation to discourse, seemingly, on all of China for many different audiences. The author falls short of this objective.

Another problem is the author's ambitious attempt to place an exposition of Chinese management techniques and economic develop-

ment within the context of a theoretical model. This also required significant expansion of the length and complexity of the discourse. The first hundred pages are thus devoted to the theoretical model and the next four-hundred fifty to the "environmental" factors informing China's economic performance since 1949. Additional material is then introduced to describe the course of China's economic development, including comparisons with the United States, the Soviet Union, Japan, and India. Only in chapters 8–12, comprising the last 250 pages of the volume, do we come, finally, to most of Richman's own findings based on his own observations. The book, thus, is really two volumes with the most important material introduced only in the second. Given this length, the reader is tempted to consult only those sections that are of immediate interest to him, causing the volume to lose its intended unity. Ultimately, it turns into a handbook.

A third problem aggravates the second. This is the author's overblown writing style and his tendency to make too many claims for his own work. The nearly one thousand pages could have been reduced by at least a third, thereby making the new material more accessible to, and easing the burden on, the reader. The reader also tires of Richman's overuse of direct references to himself and his work, especially when coupled with the words "significant" and "first-hand."

For the political scientist, the volume does hold some general attractions. It is a work on political economy — as all worthy works on China must be — and thus breaks down the artificial barriers between the two fields. It wisely views Chinese economic development not merely in the context of post-1949 history but also of pre-1949 Chinese events, of the modernization-development pattern in comparable foreign states, and of generally applicable principles of industrial management. It also treats Chinese industrial development as the rational product of environmental constraints, both physical and sociopolitical. And it stresses the constant contradiction between the Party's ideological imperatives and the demands of managerial, technical, and economic rationality.

It is well that Richman appreciates the many influences on Chinese industry. The fundamental problem of the work, however, is that it draws attention to too many factors of importance. Despite his attempt to embed Chinese industrial development in the framework of comparative management theory and practice, his good sense makes him realize that the operative principles of one field will not explain even part of the story. Lacking one or a few parsimonious and overarching principles or ideas, Richman is driven to trying to include and explain everything, and ends up leaving some of the most important questions unanswered. (One of these is the relationship of industry to agriculture in China; this is still the supreme determinant of economic activity in that country and informs the content of much of Peking politics as well. Richman ignores this issue almost entirely.) If the author had been slightly less ambitious, he would have been less tempted to introduce so much extraneous information that, in the end, makes it impossible for the reader to decide what is the central aspect of the topic. By moving outside his area of expertise, moreover, Richman is constrained to advance many questionable assertions and to generalize on the basis of quite incomplete data. Lastly, Richman did not attempt, in this edition, to take account of the implications of the Cultural Revolution for the period of the early 1960s, at the end of which his visit occurred. Many of the events he observed in the deceptive calm of mid-1966 were the very causes of the disorders that followed almost immediately upon his departure from China.

Nonetheless, much of the volume remains of worth and, thanks to a reasonably detailed index, latter-day readers can look up facts and comparisons, many of which are not to be found elsewhere. For this reason alone, the book belongs on the shelf of serious scholars of China, comparative politics, and economic development.

The Sword And The Scepter: The Problem Of Militarism In Germany. Volume 3: **The Tragedy Of Statesmanship—Bethmann Hollweg As War Chancellor (1914–1917).** Volume 4: **The Reign of German Militarism And The Disaster Of 1918.** By Gerhard Ritter. (Coral Gables, Fla.: University of Miami Press, 1972 and 1973. Pp. vii, 611 and viii, 496. $18.00 each.)

The late Gerhard Ritter was always more interested in writing about individuals than about the impersonal forces that influence the historical process, and this was never more evident than in his great work on German militarism. The first volume of this comprehensive study of the endemic conflict between civilian and military authority concentrated upon Bismarck's successful struggle against Chief of Staff Moltke for the control of policy during the wars of 1866 and 1870; and the bulk of the second was devoted to an analysis of the theories of Schlieffen and Tirpitz and a

description of the corrosive effects that their authority had upon German statecraft before 1914. The third and fourth volumes, now available in the excellent translation of Heinz Norden, are in the same mode, the former being dominated by the melancholy figure of Theobald von Bethmann Hollweg, who finally lost the battle for civilian supremacy that Bismarck had fought so robustly, the latter by Ludendorff, who, in his bland arrogance, proved that all of Bismarck's fears of military encroachment upon the sphere of national policy were justified.

In recent years, the policy of Bethmann Hollweg has been a subject of lively debate among historians, and Fritz Fischer *(Griff nach der Weltmacht,* 1961) and his followers have sought to prove that, far from being an opponent of the grandiose schemes of the soldiers, Bethmann was as much an expansionist as they. This thesis Ritter rejects, and his third volume raises serious questions about Fischer's use of documents and his tendency to generalize from inadequate data. His own view — and it is supported by the recent publication of the diaries of Bethmann's secretary, Kurt Riezler — is that Bethmann always regarded the ambitions of the soldiers as unrealistic and their intrusions into the sphere of policy determination as dangerous, but that he never possessed the cheerful self-confidence and combativeness of Bismarck and hence was ineffective in maintaining his position. In Ritter's view, he was too much the intellectual, lacking a "wholly secure instinct for power," and was too conscientious to stand up to the willful unconditionality of people like Ludendorff. Moreover, even if his temperament had been less scrupulous, he was handicapped by the fact that, in wartime, popular opinion is (at least this was true during the first World War, and not only of Germany) apt to support the soldiers in any difference with politicians.

Nevertheless, Bethmann was not a weakling, and he fought more doughtily for civilian control than might have been expected—far more so (although Ritter does not make this point) than the English Prime Minister Asquith did. If in the crisis of 1914 he was overborne by the technical arguments of the soldiers and swept into a war from which he expected the worst, he steadily resisted Chief of Staff Falkenhayn's attempts to intervene in political matters, won a signal victory over Tirpitz and the admirals in 1915 in the matter of submarine warfare, and fought stubbornly for three years to prevent a self-defeating definition of German war aims by the military and the greedy economic interests. Indeed, as Ritter points out, it was his determination to keep the door open for a negotiated peace that led him to make his worst mistake, which was to urge the Emperor to replace Falkenhayn with the team of Hindenburg and Ludendorff in the hope that the popularity of the latter would give him the necessary backing to pursue moderate and negotiable war aims. In reality, the new High Command made a compromise peace impossible by being much more demanding than their predecessor had been.

Once the scales had fallen from his eyes, the Chancellor did what he could to remedy his error, and the most interesting chapters of Ritter's third volume describe his desperate attempts to extricate himself from a war which he knew could no longer be won by military means alone. His efforts were resisted by the men he had elevated to power, whose ambitions in Poland defeated any hope for a separate peace with Russia, whose insistence on retaining Belgium made negotiation with the West impossible, and whose demand for unrestricted submarine warfare brought the United States into the war. But, as Ritter makes clear, Bethmann's defeat would not have come if the soldiers had not always enjoyed public support, and if they had not found allies among civilian politicians, whose real interests might have been supposed to lie in supporting the Chancellor. It is ironic and tragic that men like the Centrist politician Matthias Erzberger and the future chancellor in the Weimar period, Gustav Stresemann, should have played key role in denying Bethmann parliamentary support in July 1917, and thus assuring his fall.

Erzberger — always much more naive than his biographer Klaus Epstein was willing to admit—may have hoped that Bethmann would be succeeded by someone (preferably Bülow) who would be more capable of controlling the soldiers. If so, he was sadly mistaken; and Ritter's fourth volume shows the full consequences of this faulty judgment. In the post-Bethmann period, all authority was in Ludendorff's hands. It is true that on one occasion Chancellor Hertling attempted to delineate in writing the appropriate limits of military authority in political matters, but he lost heart before the ink was dry on the paper, and no one tried again. It was Ludendorff who forbade new initiatives in the direction of negotiated peace; it was Ludendorff who insisted against all reason that military victory was inevitable and demanded the dismissal of those officials, like Foreign Minister Richard von Kühlmann, who had doubts; and it was Ludendorff who, as late as

October 1918, long after the failure of his much-touted spring offensive, went on dreaming of German Rivieras in the Crimea and German bridges from the Caucasus to India. Ritter is surely correct in suggesting a similarity between Ludendorff in 1918 and Hitler in 1944–1945, both lost in their delusions, and both incapable of restraint because there was no one around them with the courage to face up to them and refuse their demands.

Ritter had hoped to conclude his work with two essays dealing with the forms that the problem of militarism assumed after 1918: one on the Weimar years, the second on the Third Reich, a period in which, by a curious reversal, it was the soldiers who sought to restrain the blind militarism of the civilian leaders. He died in 1967 before he could complete this epilogue. This is regrettable, but in no way diminishes the stature of this magisterial study.

GORDON A. CRAIG

The Right Wing In France From 1815 to de Gaulle. By René Rémond. (Philadelphia, Penn.: Univ. of Pennsylvania Press, 2nd ed. 1969. Pp. 465. $10.00.)

This second American edition of Professor Rémond's elegant, erudite, and influential work (the first appeared in 1966) is a translation of the revised French third edition. It brings the account up to 1967, with a postface on the Events of 1968 which contributes little either to the previous analysis of the French Right, or to an understanding of the Events of May, witnessed by the author at close hand at Nanterre. But the final chapter, thoroughly revised to carry the study from 1940 through 1967, is full of interest. The author's shrewd remarks on the Republican Independents and their affinity with the Orleanist tradition have since been confirmed by the election of 1974 in which Giscard d'Estaing captured the conservative majority from the Gaullists and thus made himself president of France.

The author modestly suggests in his preface that "here and there" he has used the insights of the social sciences. In fact, the book remains a classic example, in the best French tradition, of the traditional study of the evolution of ideas, climates of opinion, and movements. Readers ought not, therefore, to look for much political science or political sociology. What they will find, in abundance, are shrewd *aperçus,* psychological insights, and historical analogies, based on wide reading, substantial research, broad sympathies and profound understanding. These qualities are displayed to good effect in the analyses of Orleanism; of the evolution of one branch of legitimism into a sort of "national Catholicism" under the stress of colonial wars and the challenge of communism; and of Bonapartism and its various nationalist and antidemocratic successors from Boulangism to the leagues of the 1930s, and later to a fraction of the OAS. Professor Rémond suggests that Gaullism finally succeeded in reuniting the democratic strain in Bonapartism, present in it since the Revolution, with the nationalist current which had submerged it from Boulangism onwards. Gaullism thus revived the Bonapartist tradition by bringing it back to its popular origins, restoring the alliance of democracy and nationalism.

In short, this is a sophisticated work of scholarship, designed to stimulate and provoke as well as to inform; it is directed to those already conversant with French history and traditions, not to beginning students. The latter will be puzzled by the author's allusive style, compounded by an inelegant translation, whose sentence structure and phraseology constantly remind one of French constructions. Non-French readers will be further confused not only by careless proofreading but by (for example) "Incomparable Chamber," "immitigably," and "interposed persons." The translator has also succumbed to the bad French habit of misspelling proper names, e.g. "Moseley" (spelled correctly in the French text). Finally, Professor Laux confuses, in an explanatory footnote, the constitutional limits on the legislative omnicompetence of the Assembly with the Gaullist conceit of a presidential "reserved sector," revealed by Chaban Delmas in 1959 to a Gaullist party conference.

In short, this classic essay is still well worth reading, preferably in French, but also in this adequate though imperfect translation.

D. B. GOLDEY
Lincoln College, Oxford

Modernization Without Revolution: Lebanon's Experience. By Elie Adib Salem. (Bloomington: Indiana University Press, 1973. Pp. 174. $7.95.

No Arab country has maintained a parliament, free enterprise, respect for a large number of different religious communities, and relative prosperity for as long as Lebanon. After three decades, is it valid to summarize this Lebanese experience as modernization without revolution?

Elie A. Salem, professor at the American

University of Beirut, educated in the United States and with an insider's knowledge as well of Lebanese politics, offers us an interpretation much more complex, subtle, and skeptical than the book's title implies. Salem defines modernization comprehensively as adapting, transforming and replacing traditional institutions. His honest and sensitive scholarship compels him, however, to focus on the reasons why Lebanon could not move beyond limited adaptations. He thus helps to explain, though this was not his intention, the limits upon change that led to the current civil war.

Salem analyzes Lebanese politics until now as "a mix of tradition and modernity, feudal vestiges and capitalism, [religious] confessionalism and secularism, democracy and plutocracy, rugged individualism and narrow communalism" (p. 52). To govern such a society with a government said to be based upon "conciliation and consensus" (p. 4) raises serious questions: Who decides on agendas and whose agreement is required; indeed, What are the limits of agreement? The leaders of the seventeen religious communities—usually the descendants of established and rich families—govern through cliques and clubs where they bargain with the remainder of a similar elite already successful in business, army, and church or thanks to their connections with foreign embassies. The poor —much more often Muslims than Christians— have little to bargain with in such a system, and hence receive the least. The intellectuals, dependent on the same system of preferment, are allowed to speak as a Greek chorus. Their hesitations and exhortations, worries and predictions turned out to be correct, but they were not allowed to alter the established laws of change.

Among the small groups which are in charge of political brokerage, parliament is only one of the leading clubs, and not the most powerful. No one, except at times the President, is moved to act as broker for the public interest; no one —not even he—speaks for a national constituency. Naturally, the Lebanese bureaucracy, as Salem shows in an especially vivid and effective chapter, knows for whom it is supposed to be working. Now it serves as a "bottleneck" to modernization, because of overcentralization, outmoded procedures, lack of technical skill and equipment, religious loyalties and job quotas, nepotism, bribery and laxity of performance. But any "modernization" of the bureaucracy itself which would "disregard professional, personal, familial, and factional considerations would be extremely difficult" (p. 105).

Salem's judgment on the future of the bureaucracy applies to the future of Lebanon's political system: "Lebanon's communal society has established a political formula that can both accommodate change and introduce moderate reforms, provided they do not seriously shake the foundations of the political power structure" (p. 138). This formula reflects "the constraints of confessionalism, factionalism, and personalism" (p. 38). Indeed, "jockeying for power, balancing the distribution of power among many players," and making sure that the game itself can continue—all these make "heavy claims on the time of the players and leave inadequate time or room for modernization politics" (p. 73). No wonder development planning, which Salem analyzes in particular detail, moves "cautiously, hesitantly, haphazardly, and inconsistently" (pp. 73-74).

One does not have to transform or replace anything in order to go as far as Lebanon has gone. If tradition has already taught a people the advantages of bargaining and brokerage among the already powerful, they may also be well prepared to make economic and political deals in the modern age—as long as all essential values remain convertible. People must not come to want fundamentally new kinds of relationships. The talented must continue to prefer the laming but cosy security of existing solidarity groups to the trials of fostering creativity. The poor, exploited, and excluded must not turn their very condition into an issue. Adapting is an age-old skill that has become the least effective mode for meeting the problems of the modern age. What is required instead is the capacity to overcome the cleavages and rigidities that arise in every society still trying to preserve its inherited pattern of relationships. That capacity also requires the persistent creation and nourishing of fundamentally new relationships. If this kind of transformation is the new and permanent revolution of the modern age, then it must be said that modernization has barely begun in Lebanon. People who seek to avoid this kind of revolution tend to bring upon themselves other, more old-fashioned kinds of revolution.

MANFRED HALPERN
Princeton University

Elites in the People's Republic of China. Edited by Robert A. Scalapino. (Seattle: University of Washington Press, 1972. Pp. 669. $15.00, cloth; $4.95, paper.)

The study of Chinese Communist politics has progressed from an examination of institutions and policy statements, through an analysis of leadership, ideology and elite solidarity, to a

concern with the nature, causes and consequences of elite and social cleavage. This volume gained impetus from the Cultural Revolution's demonstration that the Chinese leadership and polity were highly fragmented and that these divisions provided the basis for social mobilization and coalition building.

This edited volume is composed of articles by fourteen scholars; each treats a different level or segment of the Chinese polity. Consequently, this endeavor has the coherence problems common to many edited volumes. The absence of thematic continuity, however, is particularly serious when analyzing elites. It is difficult to imagine what meaningful definition of elites could have been employed to lump together articles about the Central Committee, provincial level leaders, minorities officials, cadres in Shanghai and Canton, professors at Peking University, and a single student. Even more inexplicably, there is no significant analysis of the Politburo, the Military Affairs Commission, or the Standing Committee of the State Council. In addition, because the book covers such diverse facets of the society and polity, the reader is left with the impossible task of figuring out how, if at all, these various levels and strata interact. Despite these difficulties, however, several of the individual articles are good and employ techniques of leadership and policy analysis that will be examined below.

Elite analyses have been based on a rainbow of assumptions about which variables are most closely linked to elite behavior. Some analysts assert that elite behavior is best predicted by aggregate attribute data, others believe that organizational affiliation is primary, while still others believe the perceptions of elite members are the crucial variables. This book gives voice to all three perspectives.

Waller (in his article about the Kiangsi Soviet's Central Executive Council and the Eighth Central Committee) and Scalapino (in his article comparing the composition of the Eighth and Ninth Central Committees) *seem* to assume that aggregate socioeconomic, geographic, educational, and career characteristics are linked to elite political behavior. Two points must be made: First of all, as Waller candidly noted, attribute data are highly fragmentary, thereby reducing the confidence that can be placed in subsequent conclusions. Key data on socioeconomic background, education, occupation, and foreign exposure are all spotty. Don Klein makes this point in his excellent paper analyzing the resources available to the scholar attempting to undertake a study of the Chinese elite. Even more fundamentally, Scalapino offers the reader no guidance in predicting elite behavior from the aggregate attribute data he provides. In the absence of some theoretical or empirical assertion about the relationship between elite attributes and elite behavior, one wonders toward what end all these data were collected? On what basis were certain variables deemed "important" and others unimportant?

The second genre of elite analysis represented in this volume views individual elite members as parts of specific organizations. "The Organization," in turn, is alleged to determine, or shape, the elite member's interests, objectives, and perceptions. The Whitson piece adopts this perspective: ". . . decisions and viewpoints within any government are structured by groups of organizations, members of which develop special interests and career investments in the survival and power of those organizations" (p. 381). This mode of analysis, though promising, has shortcomings. For one thing, members of the elite usually have several organizational affiliations, leaving the analyst to decide which ties are most closely linked to an individual's policy behavior. For instance, are the actions of a military garrison commander best explained by his ties to the Communist party, the field army to which he belongs, the military region in which he is situated, the local garrison where he lives, or the service with which he is identified? It is plausible that different policy issues would tap different organizational loyalties. Theodore Lowi's work is suggestive in this regard. William Parish has pinpointed a further difficulty which is that many of the phenomena Whitson believes indicative of purposive organizational behavior (e.g., patterns of personnel assignment) are better explained by assuming random behavior (*China Quarterly*, 56, 1973, 667-699).

Finally, one must be extraordinarily careful in ascribing "interests" to any organization. Halperin and Kanter prudently note (in *Readings in American Foreign Policy*) that organizational interests are very hard to define without a high degree of certainty about the context in which an organization's leaders view an issue. This suggests that organizational perspectives would benefit by more precise perceptual data and the use of intensive case study material.

The volume's final genre of elite analysis might be broadly termed the "perceptual school" (related to the work of George, Holsti, and Leites). From this perspective one asks, how did the specific individuals or "groups" perceive the problems and devise strategies to solve them? Richard Baum's study of lower and

middle-level rural "party power holders" (*Tang-ch'üan P'ai*) is excellent, and displays sensitivity to the fact that many possible motivations may produce any given action (p. 542). Baum charts the succession of strategies these cadres employed to protect themselves, their organizations, and their policies during the Cultural Revolution. Chang's essay analyzes the political strategies used by China's provincial leaders during the Cultural Revolution. Montaperto's essay, while *NOT* dealing with an elite by any stretch of the imagination, provides intensive motivational data on one Cultural Revolution era student.

The major difficulty with the perceptual approach, as with notions of organizational interest, is the great uncertainty about "real" elite perceptions and the linkages such perceptions have to policy behavior. Also, one must be careful not to infer motivations without sufficient data. For instance, Chang asserts that ". . . toward the end of May, the provincial leaders' feelings of uncertainty and anxiety gave way to those of apprehension. . . . They knew too well from the experiences of past campaigns that they could be adversely affected by actual or potential 'guilt by association' " (pp. 504–505). I *intuitively* subscribe to this line of argument but must note the absence of data demonstrating that provincial leaders *did* perceive things this way. Data were only gathered to show that leaders *should* have felt that way.

In this extensive volume, we see political scientists dealing with China begin to utilize an increasingly broad range of research strategies, drawing upon the socialization, organizational, and perceptual literatures. All the individual studies take as their starting point the assumption that elite and social solidarity are not givens. White's study of leadership in Shanghai (along with the pieces by Baum and Chang) moves beyond that and attempts to explore the interaction between elite and social cleavages.

Evaluating the book as a whole, one notes two overriding difficulties: First, the concept of elite is never spelled out and, as a consequence, each author employs his own definition of the term. Also, it is never clear what range of political and social events the concept of elite is useful in explaining. Second, to assume that a given category of persons (by reason of hierarchical position) constitutes an elite is to obscure a major point of contention: "Who" makes policy, and are the actors most salient to one policy area equally important across the entire spectrum of issues? Much of what we know about organizations and bureaucratic politics (e.g., from Allison, Etzioni, Holsti, and Selznick) suggests that formal position in the hierarchy is, at best, a very imperfect guide to lines of actual policy-making authority and importance.

What, then, is a next step to take in building upon the advances which this volume represents? The field might now move from the narrow analysis of leadership to the analysis of policy formulation in specific policy areas. With this orientation, one can utilize aggregate attribute data, organizational perspectives, and the perceptual literature without eliminating the possibility of finding a policy-making system in which lower participants play a vital role. Also, such a policy orientation will make it easier to clarify the relationships between leadership and organizations at different levels in the system.

DAVID M. LAMPTON
Ohio State University

Comparative Political Corruption. By James C. Scott. (Englewood Cliffs, New Jersey: Prentice-Hall, Inc., 1972. Pp. x, 166. $7.95, cloth; $3.00, paper.)

Although part of a series intended for "the undergraduate student of comparative politics," this intelligent, generally accurate, and thought-provoking little book was obviously meant for Professor Scott's professional colleagues as well. Indeed, since Arnold Heidenheimer's excellent analysis and reader *Political Corruption* (1970) lamentably has been withdrawn from circulation by Holt, Rinehart and Winston, Scott's book is the only comparative study of political corruption currently in print. It reflects the increased interest in political corruption during the late '60s and early '70s among political scientists and especially students of less developed areas. Professor Scott's own research on corruption (published in various journals), as well as new information and thought, is incorporated in the book.

Comparative Political Corruption falls into three parts. The first part defines political corruption and argues that the phenomenon should be investigated as a special case of political influence. The second and third parts are respectively comparative analyses of administrative and electoral corruption. Definition of the field is an important problem for students of corruption since it influences not only what they are studying but their perspective on the subject. Scott, following J. S. Nye, defines corruption as "behavior which deviates from the formal duties of a public office (elective or appointive) because of private-regarding (per-

sonal, close family, private clique) wealth or status gains; or violates rules against the exercise of certain types of private-regarding influence" (p. 4). Most students of the subject would agree that corruption involves violation of the norms of a political regime. More controversial is Scott's decision to limit corruption to violations resulting from material inducements. He is certainly in good company in adopting this restricted view, since "corruption" for centuries has frequently been associated with bribery, and since such authorities as Heidenheimer and Nye continue in the tradition. Other traditions, however, include other types of influence besides wealth and status. Thus, the British Corrupt and Illegal Practices Act of 1883 considered as types of electoral corruption not only bribery and treating but also "personation" (a type of fraud) and "undue influence," which involved the use of "force, violence and restraint."

It is important to distinguish various methods of corruption for purposes of political analysis, since one can often substitute for another and since particular methods may be associated empirically with types of regimes or stages of political development. I would argue that political corruption as a field for research is too narrowly defined if limited to one cause of the violation of regime norms; namely, particularistic material incentives. Scott, by distinguishing between corruption on the one hand and fraud and intimidation on the other, finds that the Nkrumah regime in Ghana ceases to be of relevance to the study of corruption after 1960 when material inducements became less important in maintaining Nkrumah's rule and fraud and intimidation became dominant. Surely those who supported the formal norms of the Ghanian regime were just as outraged when Nkrumah and his colleagues violated them by fraud as when they violated them by bribery. In eliminating fraud and intimidation from his concept of violence, Scott may underestimate the degree of corruption in modern political systems where there does appear to be a marked decline in bribery and similar practices. If Watergate is any guide, fraud and intimidation may well be the dominant forms of corruption in modern societies.

Scott devotes the bulk of his book to comparative analyses of administrative corruption based mainly on case studies of early seventeenth-century England and contemporary Thailand, and of electoral corruption based mainly on eighteenth- and early nineteenth-century England and contemporary Ghana and India. Corruption of and by bureaucrats, he observes, is the distinctive pattern of corruption in autocratic regimes in which electoral competition is of little or no significance. When victory in electoral competition becomes necessary to remain in office and yet the electorate fails to be motivated by ideological and policy inducements, then electoral corruption is likely to be found. Scott's examination lays special stress on the use of electoral corruption by political machines, the discussion of which alone is more than worth the price of the book.

Scott occasionally overstrains his comparisons of pre-twentieth-century English and contemporary Afro-Asian corruption, although he is clearly correct in his general position that European regimes of the past were in certain significant respects, including corruption, similar to many of those in Africa and Asia today. Inevitably he is more familiar with some of his cases than others. Many historians would, for example, find his suggestion that ideological and policy considerations were relatively unimportant in Jacobean England misleading to say the least. Moreover, by assuming that during that period he is dealing with what he calls "proto-corruption" (not illegal and thus, in his view, not corrupt), Scott is making an historical error, since bribery of officials has been illegal in England since medieval times. He also fails to indicate the way in which corruption as perceived by anti-court elites—the so-called Country party—undermined the legitimacy of the Stuart regime. Corruption, because it can occur only when formal regime norms supported by some parts of society are violated, will inevitably lead to some degree of disaffection toward the norm violators. When the disaffected are politically powerful and have other reasons as well for opposing those perceived as corrupt, the latter can find themselves in serious trouble. Their actions are viewed not only as wrong but also as illegitimate while the actions of their opponents, whatever other their actual motives, gain in legitimacy.

Democracy and Political Change in Village India: A Case Study. By A. H. Somjee. (New Delhi: Orient Longmans Ltd., 1971. Pp. xxvii, 189. Rs 25.00.)

Confronted by earlier failures, governments in many less-developed countries are seeking to redefine strategies of rural development. They have been joined in this effort by numerous international agencies, i.e., The World Bank

(IBRD), the FAO, and the ILO. In this reassessment, the role of structural-institutional factors has received increasing attention. Therefore one turns to Somjee's study of institutional change in rural India with considerable interest. India's attempts at planned institutional and social-structural change span almost three decades, and have been the object of a substantial amount of research.

What Professor Somjee has given us is a case study of the impact of the introduction of a local village panchayat (council), elected by universal adult suffrage, upon the traditional social and political systems of a village in the State of Gujarat, near the city of Baroda. He has conducted research in this village on a number of occasions since 1959. The historical perspective which accrues from these earlier studies adds an important dimension to this work. Six of the seven chapters are concerned with politics at the local village level. A seventh chapter assesses the impact upon village politics of the General Elections of 1967.

His work confirms numerous earlier findings. One consequence of adult suffrage has been a redefinition of the criteria for leadership. Status, as determined by land ownership, wealth, and high caste membership continues to be perceived as a requisite for leadership. To it has now been added skill in bargaining, and the ability to mobilize a significant number of followers as a basis for entry into the coalition-making process which invariably follows local elections. The study also confirms the role of ascriptively defined groups, rather than individuals, as the essential building blocks of rural political alliances. Within this context, the need to secure majority support has led to the bridging of social divisions within the rural polity, resulting in intricate alliances of caste groups from all levels of the status hierarchy. In the process, some leverage has accrued to lower-caste groups, but not very much. Finally the study also confirms earlier findings of the rapid generational shift in leadership, following the introduction of local self-government. In the village under study, a bifurcation of leadership roles has taken place in which members of the older generations continue to exercise social leadership, whereas political leadership has shifted to the hands of the younger generation.

In his analysis of the failure of the village panchayat to become an effective representative institution within the village, Somjee has made a useful contribution at a descriptive level. He identifies two patterns of behavior within the village as having undermined the effectiveness of the panchayat. The first of these he characterizes as "the direct approach," by which he means the tendency of villagers to bypass the panchayat as an institution for local conflict resolution and decision making, and to approach district level administrators and political leaders directly, seeking their intervention in local problems. This practice, a continuation of traditional pre-independence patterns of behavior throughout India, was condoned, and even encouraged, by officials at higher levels of authority. They used these opportunities to build their own support. The net effect was to remove from the panchayat issues upon which it could have taken decisions, and hence established its effectiveness. The author characterizes the second pattern of behavior which undermined the panchayat as "the mass approach," an essentially populist stance, encouraged by a Gandhian worker who came to the village, and sought to bring about total community involvement in local affairs. The net effect of the mass approach was to blur the role the panchayat as a representative institution for the village. Finally, Somjee describes the ways in which higher authorities frustrated attempts by the panchayat to raise financial resources. These actions on the part of the authorities would seem to indicate that they were not seriously committed to making the panchayats effective instruments of local self-government.

While not ostensibly a part of his analytic framework, two other factors of considerable importance for students of rural development and institution building are discussed by Somjee. The first of these is the opening up for villagers, particularly the landless, of employment opportunities in the nearby city, Baroda, completely outside the control of the village economy. The second factor is the marked increase in opportunity for both primary and secondary education in the village. Both of these changes facilitated challenges to social and political structures which critically influenced the entire system of distribution of power within the village. This, in turn, reinforced the overall impact of majority rule in the elective process. Ironically, while the institution of the panchayat was ineffective, the net consequence of its introduction was to significantly alter power relationships within the village.

I was disappointed in this study for several reasons. Analyses of village politics have been undertaken for several decades in rural India, yet there is little evidence here that any significant methodological advances to systematic assessment have been made. Basically what was utilized in collecting data for the first six chapters of the study was the anthropological par-

icipant observer technique. All of the predictable limitations upon generalizations which arise out of a case study so defined are present. The final chapter discusses the impact of the General Election of 1967 on village politics. We are told that a systematic sample was drawn based upon the village voting list and a survey conducted. The presentation of data leaves much to be desired. In almost all instances only raw data are presented, with no percentages and few cross tabulations. Furthermore, since Somjee makes no attempt to assess the statistical significance of findings, the reader cannot evaluate his argument that national politics has had a "destructuring impact" upon the village.

The empirical findings of this study seem to support the view that planned, structural-institutional intervention is able to bring about significant changes in political behavior. Unfortunately this book does not make a contribution to the development of theory in this regard.

Soviet Criminal Law and Procedure: The RSFSR Codes. 2nd edition. Introduction and Analysis by Harold J. Berman. Trans. by Harold J. Berman and James W. Spindler. (Cambridge, Mass.: Harvard University Press, 1966, 1972. Pp. 399. $12.00.)

It is a pleasure to welcome the second edition of this fine volume. In its basic format the book remains unchanged. As before, it contains a good literal translation of three pieces of Soviet legislation—the RSFSR Criminal Code, the RSFSR Code of Criminal Procedure, and the Law on Court Organization of the RSFSR —*and* a long (125 pp.) introductory essay by Professor Berman, which treats such topics as the history of the codes and of changes in them and the role of the procuracy and of the legal profession in Soviet criminal law and procedure. The decision to prepare a new edition of this book just six years after the first one was prompted by the large number of changes made in Soviet criminal legislation during the interim, so many as to render the original translation obsolete.

Readers familiar with the first edition will also discover that the excellent introductory essay by Professor Berman now includes a new section on the criminal codes and criminal procedure codes of the other republics (written by Mr. William Butler), a more detailed discussion of the problems of translating Russian legal language (largely to answer critics of the first edition), and an extended chapter five "Changes in the 1960 RSFSR Codes, 1961–1971," (written with the collaboration of Mr. Butler). It is this chapter on recent changes in Soviet criminal and criminal procedure legislation which has particular interest for political scientists since it provides both an overview of trends in Soviet criminal policy of recent years and a useful analysis of the relevance of Soviet criminal legislation for the control of political dissidence.

In assessing trends in Soviet criminal policy during the 1960s, Professor Berman claims that despite some changes in the direction of leniency or of rationality, the general tendency was for penalties to be made harsher (p. 71). Without doubt this interpretation stands as a correct description of the decade of the 1960s as a whole; yet, in my view, it leaves a somewhat inaccurate impression of the direction of Soviet criminal policy during the second half of the 1960s and by implication in the early 1970s as well. The bulk of the changes in Soviet criminal law during the 1960s which increased the severity of punishment came in the first half of the decade, and, as Professor Berman indicates, constituted a reaction to the extreme leniency of some provisions included in the new code of 1960. This reaction, however, was short-lived, and the "law and order" mood of the early 1960s gave way in the later half of the decade to an *eclectic* criminal policy. Some of the measures introduced in these years resulted in harsher sanctions, others in milder ones; most shared the common aim of reducing and preventing crimes with whatever tactics seemed most likely to succeed in the light of current scholarship and practical experience.

Professor Berman's treatment of the legal control of dissent in the 1960s begins with an analysis of the changes in the criminal law prompted by the prosecutors' difficulties at the Sinyavsky-Daniel trial—changes which "now make it possible to catch almost any strong expression of political dissent" within the ambit of one or another provision of the criminal code" (p. 83). The discussion then proceeds to the procedural aspects of "political trials," a matter of considerable importance for the conflict between regime and dissenters. "The underlying dilemma," writes Berman, "is that the Soviet political authority seeks to legitimate its struggle against dissent by reliance upon the Criminal Code and the Code of Criminal Procedure, while the dissenters invoke the same codes to legitimate their opposition" (p. 89). Thus, Professor Berman puts in a nutshell the importance of Soviet criminal law and pro-

cedure for an understanding of dissent and its control in the USSR.

In its presentation as well as in its substance this book is a model of its kind. There is a comprehensive index (prepared by Malcom Hinden), as well as a glossary of Russian legal terminology, and appendices useful to the specialist.

PETER H. SOLOMON, JR.
University of Toronto

Angola. By Douglas Wheeler and René Pelissier. (New York: Praeger, 1971. Pp. 296. $11.00.)

Most literature covering the anticolonial insurgencies that felled Portugal's *ancien regime* is lopsidedly Afro-centric. It slights the European dimension of wars which were ultimately "lost" in Portugal itself. The volume under review represents an important exception. Its first, longest (155 pp.), and most valuable section constitutes an excellent summary of European-African interaction during some five centuries of Portuguese presence. In it Professor Douglas L. Wheeler, a careful, thorough researcher, has drafted a clear and concise history drawing upon the full range of primary sources available before the coup of 1974.

Neglectful of neither the precolonial history of Angola nor the complex motives and patterns of Portuguese penetration, Wheeler presents a judicious, well-balanced overview. As background reading to the political drama of contemporary Angola these first six chapters are unexcelled. They reflect the patient labor of an historian who has dug deep in the archives, then organized and analyzed his data with dispassion. Especially insightful are Wheeler's appraisal of the role of Angolan *assimilados* (pp. 93–98) and his assessment of race relations (pp. 106–08, 111–115) in colonial society. His chapter on "Angola and the Republic, 1910–1926," suggests interesting historic parallels at a time when Portugal's Second Republic, 1974–?, no less troubled and fragile than the first, is trying to extricate itself from the wreckage of collapsed empire. Wheeler concludes his historical synthesis with a survey of Angola under Antonio Salazar's *Estado Novo* that focuses on the genesis of the impending clash between Portuguese and African nationalism.

The collision that ensued led, after thirteen years of insurgency, to the death of Portugal's Eurafrican illusions. René Pélissier, a French writer who has specialized in the military history of Portuguese- and Spanish-speaking Africa, describes this collision of the 1960s in three chapters (pp. 159–239) that contrast sharply with those that precede. With a confident, often acid, pen he chronicles and judges, relying largely on inadequately acknowledged secondary sources and interviews with Portuguese military and government officials in Angola. The result is a provocative, sometimes insightful, but error-plagued and tendentious analysis of the first ten years of the Angolan war.

After noting quite properly that "any study of Angolan problems must be an exercise in scepticism" given the unreliability of documents, informants and reportage, Pélissier throws caution to the winds. His assertions and speculations are often plausible and intriguing but left unsupported by evidence: e.g., the notion that Lucio Lara (not Agostinho Neto) "is now perhaps the most active and important MPLA leader" (pp. 164–5); that the Congolese *Parti de la Solidarité Africaine* (PSA) was somehow implicated in Angolan affairs (pp. 167 and 174); that the American Committee on Africa helped to strengthen UPA "contacts with the Baptist Church" (p. 169); that "not only Angolans but a sizable number of troublemakers from the Léopoldville population" invaded northern Angola in March 1961 (p. 181); or that in spite of the war there was overall "a decided improvement in Angolan race relations" (p. 235). An uncritical acceptance of official Portuguese versions of events is the distorting variable. Pélissier relates as unquestioned fact reports of drugged insurgents massacring whites, *mestiços*, and ethnic rivals and derides nationalist leadership as unworthy and incompetent. The uprising of 1961 was "a caricature of a successful nationalist revolt" (p. 177). And occasionally, Pélissier's facts are clearly wrong. Rather than seeking to "rejoin" the MPLA (which he claims never to have belonged to) in 1964–65, the Ovimbundu leader, Jonas Savimbi, refused to join on terms offered and chose instead to form his own movement (p 224).

If one accepts Pélissier's work on its own terms, however, as a pungent, personally engaged critique of an African insurgency, its value is quickly apparent. His stress on ethnic disunity, leadership shortcomings, and strategic errors may be Gallic but is also insightful. For example, he writes tellingly of the UPA insurgency in northern Angola:

> It began with a massacre, and continued with a more skillful form of guerrilla warfare. The UPA enjoyed the support of the Bakongo masses but it had forced them to abandon their means of livelihood and, instead of

making hundreds of thousands of combatants of them it only created refugees. More serious, the flight of the Bakongo into the bush, though giving it short-term support, deprived it of the indispensable complicity of a settled population, essential to a long struggle (p. 187).

Pélissier outlines timid administrative reforms such as the new labor code that followed the outbreak of hostilities in 1961, credits the nationalists with hastening their advent but at great human cost, and reflects on the irony of "a war which slowly exhausts Portugal" but infuses the purchasing power of 50,000 European soldiers, new settlers and foreign investment in mineral extraction, and thus "develops Angola" (p. 199). And in the light of subsequent events, Pélissier's assessment of the Portuguese military was prescient: he found "a lack of enthusiasm among some Portuguese officers" who, viewing victory as problematic, did not "go to the limit of their human and material resources" and suffered from bad morale (p. 230).

The volume ends with a short wrap-up chapter by Douglas Wheeler in which he underscores the economic development in Angola during the war years, argues that of all European colonizers the Portuguese "have maintained the friendliest and least race-conscious relations with black Africans" (and the French?) and concludes that nationalist divisions made the possibility of Angolan independence during the next decade "rather remote" (p. 250). Indeed, had nationalist insurgents in Guinea-Bissau and Mozambique not been much more effective than their Angolan counterparts, had it all depended upon Angolan nationalists, such an assessment might have proved right on target. With sobering foresight, Wheeler conjectures that "if Angola were given independence tomorrow, the resulting loss of life might well make the Congo crisis of 1960–64 pale in comparison."

A series of well-designed maps, a useful, select bibliography, separate indices for names and subjects, and a table of Angolan organizations with their common abbreviations add to the usefulness of a volume of uneven but lasting merit.

JOHN MARCUM
University of California, Santa Cruz

Economics and World Order from the 1970s to the 1990s. Edited by Jagdish N. Bhagwati. (New York: The Free Press, 1972. Pp. 365. $3.95, paper.)

How successfully can social scientists predict the future? Of what value is the conference mode for doing so? Is it possible to compile a sensible volume based on the contributions of a diverse group of scholars? Insofar as domestic and international seminars appear to have become the hallmark of our time, and increasing numbers of books based on papers contributed to such meetings are being published, it is reassuring that, even though *Economics and World Order* was written before the Limits to Growth thesis and the energy crisis had burst upon us as the preoccupations of our generation, it is worthy of attention.

This volume, which deals with the wide range of issues implied by a futuristic look at the preferred world economic order in the years 1990–2000 and the paths by which an optimal society might be attained, had its origins in the World Order Models Project of the World Law Fund. By combining papers presented at a 1969 meeting in Northfield, Massachusetts, with a number of invited contributions and an introduction by Jagdish Bhagwati, who edited the papers, the volume seeks to be comprehensive, multidisciplinary, and consciousness-raising. To fill this tall order, of course, would have been a monumental task. What is surprising, therefore, is not that the book falls short of its objectives, but that it comes so close to fulfilling them.

In the lead article Bhagwati establishes parameters and makes clear that the primary economic value toward which the preferred world order should aim is better welfare for the world's poor people (a strong point of the volume is its emphasis on people rather than nations); he also asserts that international and intranational income disparities are near the center of the issue. Bhagwati's introduction mixes conventional and unconventional wisdom in dealing with issues such as foreign aid, brain drain, science and technology, and it concludes with the questionable propositions that world famine is unlikely and that world population growth will gradually diminish and is no cause for alarm.

Subsequent articles by P. N. Rosenstein-Rodan and Thomas Weisskopf present traditional liberal and New Left perspectives, respectively, on the outlook for the poor. Each contribution, in its own way, has an air of unreality: Rosenstein-Rodan brilliantly and succinctly describes the evolution of economic disparities since 1800 and the steps needed to narrow them in the next several decades, but he leaves the reader without any feeling for whether, or to what extent, the needed steps

will be taken; Weisskopf's argument is so heavily laden with assertion and value judgment that it requires an act of faith to agree with his thesis that elites will "ultimately give way to revolutionary movements" (p. 66). Similarly, the two articles contributed by socialist authors, Jozef Pajestka and Lev V. Stepanov, are unlikely to move readers other than those who are already committed. These contributions both suffer badly from (1) the false assumption that only doctrinaire socialism has the capacity to satisfy social values and (2) the authors' felt need to make as many unkind comments about capitalism as possible.

The next four articles provide meaty, if not always balanced, analysis of the role of international institutions. The late Stephen Hymer has written a trenchant attack on the social and economic impact of multinational corporations, unfortunately not paired with another article taking the opposite viewpoint. Both Harry Johnson's analysis of international trade and payments arrangements and Robert Triffin's discussion of how the world monetary system should and may become substantially more internationalized by the year 2000 are workmanlike and comprehensive. These pieces have the particular virtues of first, not being dominated by the theme of how the situation of poor countries can be aided irrespective of other goals and, second, taking a serious view of how growing international interdependence has led to—and may continue to lead to—a better world order. Jan Tinbergen has written a faintly optimistic essay and, in dealing with the "development decade" concept and various global development strategies, he seeks to broaden the perspective in which the issues of development are considered.

The last third of the book, which deals with the new world order from the perspective of various developing regions, is uneven. It includes articles on Latin America by Osvaldo Sunkel and Carlo Diaz-Alejandro, on Africa by Dharam Ghai and Ali Mazrui, on China by Shigeru Ishikawa, and on India by Pitambar Pant. These regional views are instructive, particularly the analyses of Dias-Alejandro and Mazrui, but they often fail to go beyond a regional perspective. (For example, more is made of the Latin American Free Trade Association and the Central American Common Market than is justified by economic theory or prospective economic or political relationships among the countries concerned.) To the extent that the authors of these regional articles are especially prone to wishful thinking, have differing values, and do not clearly define the objective to be reached by the end of the century or th paths for moving in those directions, thes papers illustrate the inevitable problems whic dog any effort to deal with futuristic and har subjects. Similarly, these and earlier article deal with isms such as capitalism with littl feeling for the impurity of the systems as ac tually practiced. Illustratively, there is no effor anywhere in the book to distinguish difference among non-Communist industrialized coun tries or to recognize the prevalence of mixe economic systems.

The great strength of this book, aside from its presentation of a stimulating panoply of related ideas, is that it makes a coherent case for rapid social change and suggests the means whereby it may occur. Although Bhagwati and his coauthors could not have foreseen the realignment of world economic power which followed the 1973 Middle East War and could not have known that the Third World political coalition in the United Nations would loom as a potential power as early as 1974, they have addressed their respective subjects at a level which makes these real-world events understandable. The happy explanation for this is that most of the articles are written from more than a narrow economic perspective; they are broadly based in the world of political economy and focus on issues which are so critical that they are bound to remain relevant.

LAWRENCE A. VEIT
Council on Foreign Relations

The Moscow Agreements and Strategic Arms Limitation. By Hedley Bull. Canberra Papers on Strategy and Defence, No. 15. (Canberra: Australian National University Press, 1973. Pp. 50. No price indicated.)

This brief study of the 1972 SALT agreements undertakes first to measure them against the goals of arms control. In considering whether they have reduced the likelihood of war, Hedley Bull does not discuss the common assertion that the very placing of limits on arms has decreased tension and the likelihood of war; he has long criticized the notion that arms races, as such, cause wars. Rather, he concerns himself primarily with how the agreements have affected the possibility of a partial disarming strike by one side. Professor Bull shows very well (p. 13) how the agreements have not enhanced second-strike deterrence; he concludes that limiting the vulnerability of fixed land-based missiles is the most important task of present negotiations. Bull's own sugges-

tions are not, however, very promising. Bull goes on to refute concisely the widespread belief that the Moscow accords enshrine the purely deterrent strategy of Mutual Assured Destruction. Indeed, the SALT accords have, since Bull wrote, probably contributed somewhat to acceptance of Secretary of Defense Schlesinger's "counterforce" strategy.

Turning to the political meaning of the Moscow agreements, Bull concludes that "the terms of the interim agreement [on offensive forces] are remarkably one-sided" in favor of the Soviet Union. But critics' fears of the agreements' effects on American attitudes towards her allies are very exaggerated, even if their "general thrust" is correct. Bull mentions only in passing the possibly much more important question of allied attitudes towards the United States.

Bull's presentation of SALT clarifies the issue very impressively. The reader may wonder, however, whether some further motives and results should not have been treated. To take the simplest examples, Bull does not choose to discuss the evident attempt of each side to disarm the other's superiority (Soviet missile payload, American ABM technology). When the Soviets brought up American Forward-Based Systems in Europe and "provocative attacks" by third powers, they may have shown a second intent to sow trouble between a nation and its allies. Another, less fully intentional, result of the SALT negotiations has been an *increase,* rather than a decrease, in many weapons. Formal comparison calls attention to weak areas; new weapons are cultivated as bargaining chips for negotiations and as payoffs to bureaucratic groups for supporting an agreement. Examples are the Trident submarine, the B-1 bomber, and cruise missiles. These side-effects of SALT may in turn have important consequences for future arms control. Cruise missiles, for instance, may reopen the question of air defense and make limited nuclear strategies more feasible. Both cruise missiles and the B-1 will make U.S. strategic forces more asymmetrical with the Soviet missile force and may tend to increase negotiating complications and uncertainties about the political effects of the strategic balance: it will be harder to guess whether the overall strategic balance or the missile balance is the politically relevant fact. Time has also seen the ambiguities in the SALT terms grow into charges of cheating; this is another of the aspects of SALT which the author surely perceived but chose not to explore, whether for brevity or because of his focus on arms control. But one of the things the student of arms control wants to know is whether arms control agreements are the best way to achieve arms control. This is the question raised by the secondary effects of SALT discussed above. It is a question that Bull does not address. As a consequence, he did not write as interesting a study as he could have written, although it does furnish those interested in arms control or in U.S.-Soviet relations an unusually clear-headed evaluation of the SALT agreements.

CHARLES H. FAIRBANKS, JR.
Yale University

Annals of International Studies: Hydrospace in International Relations (Volume 4—1973). Edited by Lucius C. Caflisch. (Geneva: The Alumni Association of the Graduate Institute of International Studies, 1973. Pp. 372. Belgian francs 400.)

This fourth volume in the series *Annals of International Studies* is an ably edited and relatively comprehensive collection of essays on the law of the sea and related problems. Though its publication came too early for its contributors to have taken into account the actual proceedings of the Third United Nations Conference on the Law of the Sea, *Hydrospace in International Relations* ranks high among books dealing with the problems of ocean space. The fourteen essays, authored by some of the most distinguished scholars in the field, are almost all clearly written and well documented. They are substantial enough to interest the specialist. At the same time, they provide the uninitiated with a broad and systematic overview of the complex issues associated with the law of the sea.

The essays, reflecting the interests and perspectives of a variety of academic disciplines and geographic areas, are divided into three general groups. Under "general topics" are included papers on the interests of the developing countries by Ram P. Anand, on Latin American interests by Ralph Zacklin, and on the interests of the land and shelf-locked states by Vladimir Ibler. Under "special topics" are included two papers on strategic and military problems—demilitarization and denuclearization of the oceans by Edward D. Brown, and Western European interests in the Indian Ocean by Jacques Freymond; two on economic problems—ocean resources and global mineral supplies by Richard L. Gordon, and the importance of nodule mining to the world nickel

industry by Herbert D. Drechsler; and five relating specifically to legal problems—coastal state jurisdiction by Leo J. Bouchez, the archipelagos problem by Geoffrey Marston, marine fisheries by Albert W. Koers, oil pollution by Lucius Caflisch, and the General Assembly's "Declaration of Principles" (1970) by Krzysztof Skubiszewski. Under "the future regime of hydrospace" are included two papers—on the creation of an international machinery to manage the seabed by Moritaka Hayashi, and on the law of sea-mining by Louis Henkin. The book also includes an appendix containing a number of useful documents pertaining to sea law.

Much that has transpired at the Third United Nations Conference on the Law of the Sea was anticipated in these papers. The Conference, which was launched as an effort to rewrite the law of the sea, quickly expanded into a confrontation between the rich industrial states and the poor "third world" states over the political and economic reconstruction of the global order. The confrontation has been particularly harsh with respect to the creation of a regime of the deep-seabed and ocean floor (the area lying beyond the limits of national jurisdiction of coastal states), where vast quantities of valuable ferromanganese nodules are known to lie. Most of the papers in this volume reflect this rich-poor controversy, testifying to the enormous political (and ideological) handicap under which this Conference has labored.

Anand's paper ("Interests of the Developing Countries and the Developing Law of the Sea") describes sympathetically the grievances and the goals of the developing countries. The grievances are the familiar ones of poverty, the growing "development gap," and the inequitable distribution of world resources, for which the developed countries are held responsible, at least in part. The goals are, first, to secure for the developing states "the largest possible share of the resources of the seabed" (p. 23), by extending the scope of the territorial sea, for example, or by establishing an economic resource zone within which coastal states would exercise more or less exclusive control of both living and non-living resources to a distance of 200 miles from land; and second, to deny whatever is left to the developed states. This last is to be achieved by embodying in the new legal regime of the high seas the principle that the resources of the deep oceans (particularly the mineral resources of the ocean floor) are the "common heritage of mankind," to be exploited for the common good—most especially, for the good of the developing countries. Anand is aware of the contradictions in these goals: claims by developing *coastal* states to mammoth economic resource zones rather substantially diminish the area of sea space remaining for the "common heritage"—or for the developing *landlocked* states. But in remarking that the developing countries "have stood solidly behind this concept" (p. 22) of the common heritage, he may have overstated their unanimity and underestimated the degree to which the concept has been drained of any meaning—to no small extent by the "selfish" actions of the developing countries themselves.

The irony in the dispute between developed and developing states over control of ocean resources is that the only major resource with any chance of becoming the property of all mankind—the ferromanganese nodules—may result in the enrichment of very few. The nodules, which carpet up to 25 per cent of the ocean floor, do contain rich concentrations of many metals, chief among them copper, cobalt, nickel, and manganese. And there are estimates that US investments in nodule mining alone may exceed $6 billion before the end of the century. But much of the excitement over nodule mining rests on the assumption that terrestrial supplies of these minerals are limited and, in some cases, approaching exhaustion. Gordon's paper ("Ocean Resources and World Mineral Supplies") casts considerable doubt on the "exhaustion" theory, arguing that the "resource pessimists" have simply not proved their case. Ocean miners (and public policy makers), he points out, should not bank on increasing scarcity to raise prices to such levels as are required to compensate for the high costs of deep ocean mining. For if the assumption of mineral scarcity proves unwarranted, so may ocean mining. Essentially the same point is made by Drechsler ("The Significance of Nodule Mining to the World Nickel Industry"). Noting that estimated world reserves of nickel (one of the most valuable components of the nodules) rose from 16 to 75 million tons in the 10-year period 1963–1973—an amount "sufficient for 125 years at the estimated 1970 world production rate of 600,000 tons" (p. 133)—Drechsler concludes that "there is little reason to expect that many nodule mines will be producing nickel before the year 2000" (p. 139).

The supreme irony, of course, is that the global struggle to control these seabed resources has outstripped in intensity virtually every other issue before the Third United Nations Conference. Even if the nodules one day prove of great value, as many believe they will, they are today nowhere mined commercially

and their future value remains largely speculative. The law of the sea is stalked today as much by the ocean's unknown future as by its known past.

The book has a number of limitations. Some topics (e.g., economic resources) are treated at considerable length and from several perspectives, while others (e.g., preservation of the marine environment, the straits question, and scientific research) are only barely touched upon. Several papers (e.g., Caflisch, "Some Aspects of Oil Pollution from Merchant Ships") will appeal only to those steeped in the legalisms of marine jurisprudence. Two of the shorter papers are in French, which may authenticate the multinational character of the volume, but at the expense of its full accessibility to American readers. Unavoidably, the swift passage of events in the realm of ocean law has "dated" some of the materials considered. But there are enough outstanding papers in this volume to reward the reader amply. Indeed, this may well be the best general collection of essays on the international problems of the oceans yet published.

The Communist International, 1919–1943. By John Lewis Evans. (Brooklyn, N.Y.: Pageant-Poseidon Ltd., 1973. Pp. 194. $7.95.)

Outline History of the Communist International. By the Institute of Marxism-Leninism, Central Committee of the C.P.S.U. (Moscow: Progress Publishers, 1971. Pp. 563. $5.00.)

Soviet Russia Masters the Comintern: International Communism in the Era of Stalin's Ascendancy. By Helmut Gruber. (Garden City, N.Y.: Anchor Books, 1974. Pp. 544. $3.95, paper.)

The Third International or Comintern was indeed a strange historical phenomenon. As conceived by Lenin in 1916, it was designed to replace what he felt was a bankrupted Second International which had betrayed socialism when many of its members and constituent groups supported national ambitions in World War I. Enunciated in Lenin's April Thesis, the concept of a Third International became part of the Russian Bolshevik's revolutionary program in 1917. Revolution and Civil War, however, delayed its founding until March, 1919 when the poorly attended Organizational Congress of the Comintern met in Moscow. Viewed by many western Socialists as something less than desirable, the Third International was from the beginning dominated by Russian leadership. The organization had two integrated objectives. Publicly the Comintern was to plan, promote, and direct the pending world socialist revolution. Its unpublicized objective was to aid the Bolshevik's Civil War effort against the White Armies and foreign interventionists, and thus help to protect the socialist experiment in Soviet Russia. As Helmut Gruber writes: "In one of those strange ironies of history the Comintern was both inspired by and the victim of the Russian Revolution" (p. 509).

Until it was quietly and mercifully dissolved in May, 1943, the Comintern had a long and inglorious record of failures both as a socialist international and after 1925, as an organizational tool of Stalin's foreign policy. Even its limited accomplishments were ephemeral and in the end proved to be ideologically destructive to the dream of a world socialist order.

In recent years considerable interest in the Comintern has been shown by Western historians and political scientists, and a number of excellent analyses and accounts have appeared. For example, one thinks immediately of the work produced by Branko Lazitch and Milorad Drachkovitch (*Lenin and the Comintern,* Stanford, 1972), and of the documentary collections edited by Jane Degras (*The Communist International 1919–1943: Documents,* London and New York, 1956, 1960, Vol. I: 1919–1922, Vol. II: 1923–1928). It would be nice to be able to report that the three volumes being reviewed here have something to add to our knowledge and understanding of the Comintern and its activities. Unfortunately, that is only the case with one of them.

Evans's *The Communist International, 1919–1943* is a book which really has to be read to be believed because no review could ever do it justice. After the first chapter the reader's reaction is one of shock and wonder as to why anything of this quality should have been published. After the second chapter, one is simply disgusted and appalled thinking of the number of trees sacrificed to produce the paper for this volume. By chapter three, however, the reader can settle down and begin to enjoy this book in a masochistic sort of way. One approaches each new page with satanic anticipation as to how many spelling errors and misprints will be counted (e.g., Li Tao-chao for Li Ta-chao, p. 96; Kugomintang for Kuomintang, p. 93), and what odd commentary will be found next. For example:

> The future fate of the Third International was very closely tied up with domestic events

> in Russia. Lenin asked the Zimmerwald Union, to which the Left tenuously adhered, to help bring pressure on the socialist groups in Russia to withdraw their support from the Provisional Government. The Bolsheviks led the Zimmerwald Left, and they were to lead all Russia. There was just no end to their achievements; a new international would make them rulers of the whole world, and it was inconceivable that it could fail. After November, 1917, the term Zimmerwald Left was dropped and Bolshevik took its place (pp. 21–22).
>
> The international Bolshevik movement did not go out of existence on May 15, 1943. It stayed alive and is alive today. However, the aspect of world Bolshevism that was called the Comintern ceased to exist after 1943 (p. 176).

Although promoted as an overall history of the Third International, the book in its own mysterious way deals primarily with Comintern activities in Germany, France, China, and Spain. Even in the best books the Spanish and Chinese Civil War situations are recognized as highly complex. Here they are treated in such a disjointed manner that the complexity becomes chaotic.

Unless the reader possesses a fair knowledge of international communist activities he will find this book nearly incomprehensible. One reason is that the work is so poorly organized. Paragraphs often seem to be inserted at random, with no relevance to what came before or to what follows. Biographical sketches, which belong in footnotes, are interpolated into the text effectively ruining whatever continuity the section attempted to maintain. According to the publisher, the book is a revision of the author's M.A. thesis. One can only charitably assume that it is a thesis sadly mutilated by scissors and paste, and then further disfigured by editorial incompetence. If the thesis contained any new material or original analysis, it was certainly lost before the work found its way into print. According to the bibliography, the book is based almost entirely on secondary sources, and even these are too often handled in a rather cavalier fashion. In his conclusion the author writes: "In the history of the Third International from 1915–1943, three periods of its activities have been distinguished, *although not always clearly*" (p. 176). To that one can only add, Amen!

The *Outline History of the Communist International* is mistitled "A Detailed and Exhausting History . . ." would be more appropriate. Here the reader will find more minutiae on the Comintern than he or she ever wanted to know: all presented in an agonizingly pedantic style. It is a typically Soviet historical study, produced by a committee of eight authors headed by A. I. Sobolev, with an obvious ideological bias.

Every phase of Comintern development and all personages involved are portrayed as dictated by the correct Party line as of 1971, the date of publication. This is the Comintern's history as seen in the Brezhnev-Kosygin period of interpretation. Here one finds the wise, all-knowing Lenin skillfully establishing a theoretical and organizational structure for world revolutionary leadership. There is the pragmatic, but slightly overbearing Stalin dexterously formulating and implementing Comintern policies and activities. Then, of course, there is the muddle-headed, diabolical Trotsky subverting the Comintern with his mistaken permanent revolution theories and insatiable political ambition. In this study the Comintern's problems seldom, if ever, originate in Moscow but arise from ineffective implementation in the field because of local Communists' inexperience, ignorance, or corrupting nationalistic attitudes.

The western reader will regard the volume's interpretations and analyses of events with incredulity. One example will suffice. In 1943 the fact that the Comintern was arbitrarily abolished by Stalin because it had become an embarrassment to the Soviet Union's war-time alliance with the capitalist West is not mentioned. Instead the *Outline History* tells us that the Comintern was abolished only after long deliberation among party representatives from around the world who finally voted *unanimously* for dissolution because "under the conditions of the war the existence of the Communist International was used by the reactionaries to slander the Soviet Union and the communist parties of the different countries" (p. 512).

The final chapter of the *Outline History,* entitled "Traditions of the Comintern and the Present-Day Communist Movement," lays great stress on the heritage of the organization in creating international solidarity among the world proletariat and the downtrodden masses, and on its legacy for a bright future of world communism under the guidance and leadership of the USSR. Then, near the end, the authors inform us that

> a heavy blow to the unity of the world communist movement has been dealt by the Mao Tse-tung group, which has sunk to anti-Leninist positions and is pursuing a Left-

ist adventurist policy of great-power chauvinism in the international arena and the world communist movement.

> The opportunist degeneration of Mao Tse-tung and his group is a logical evolution and consummation of their erroneous political and theoretical views which the Comintern had once combated (p. 558).

So much for the heritage of communist international solidarity and for the Comintern's legacy to the modern world!

After Evans and the *Outline History* one turns with relief to Gruber's *Soviet Russia Masters the Comintern.* Although making no really new contribution to historical knowledge, this volume does provide a good coverage of the 1924–1929 period. It is the second volume in Gruber's projected trilogy on the fate of international communism from World War I to 1939. The first volume, *International Communism in the Era of Lenin,* appeared in 1967 and received generally favorable criticism. We now await volume three on *International Communism in the Shadow of Fascism.*

The basic theme of this book is obvious from the title. The years 1924 to 1929 witnessed the complete bolshevization of the Comintern. The organization was turned away from its international objectives, becoming merely an additional vehicle to further the foreign policy objectives of the Soviet Union. The Comintern was indeed forced by Stalin to align its activities with his doctrine of "Socialism in One Country"—a transformation closely associated with Stalin's own triumphant rise to totalitarian power within the Soviet political structure. Although Stalin must bear primary responsibility for the Comintern's character in the second half of the 1920s, Professor Gruber emphasizes that Stalin was working from a contradictory theoretical base for the Third International established by Lenin in the early 1920s.

> The Comintern's move toward a more hierarchical structure was in part a continuation of precedents established by Lenin who, in an attempt to avoid the lack of focus and indiscipline of the Second International, sought to transfer the rigid organization of his bolshevik party to the Third International. The bolshevik leaders of the Comintern chose to build on these precedents in part because all of Leninist practice had already been mystified and given the force of law by those struggling for the succession (pp. 506–507).

Trotsky too must share the responsibility for the bolshevization of the Comintern. His much publicized opposition to Stalin's foreign policy and Comintern activities came after the bolshevization process had become irrevocable, and only when the organization was displaying an ineptitude which could no longer be ignored.

This volume is divided into two parts. The first deals with the bolshevization process and the second with "the Comintern and Colonial Peoples." The two parts are each divided into three sections. For example, part two covers the theoretical ambiguity of the Comintern's approach to the colonial empires in Africa and Asia, and then moves on to investigate in depth China as the "Waterloo of Comintern colonial policy: prologue and dénouement."

Gruber's comments on China in the 1920s are perceptive and interesting. Stalin's Comintern policy for China displayed a wide ranging incompetence that is almost uncanny. If a wrong option was available, it was selected. If a false reading and analysis of the situation could be made, it was done. If bad and misleading counsel to the Communist Party of China was conceived in Moscow, it was always given. When the ailing fortunes of the CCP finally reached rock bottom after 1927, it was the Soviets' view that the "inept leadership" of the Chinese party had to accept the blame. The Comintern/Stalin policy could never have been wrong. It is little wonder that Mao Tse-tung developed a healthy suspicion in the 1920s that Moscow might not be the fountainhead of all wisdom; that Stalin's aid and advice was determined first and foremost by Soviet national interests; and that the welfare and success of foreign communist parties was a low priority in the Kremlin. The bitter seeds of the Sino-Soviet dispute had been deeply planted.

Each section of the Gruber book is introduced by a clear, carefully constructed historical essay followed by a selection of documents chosen to illustrate the basic tenets set forth in the essay. The sections end with a brief selection of "further readings." The volume also contains a helpful selected general bibliography and a very competent and useful index. This work can be recommended without hesitation as a sound introductory text on international communism in the 1920s. It should prove useful as collateral reading in courses on the history of Soviet foreign policy.

Readers may recall that during the 1920s western reaction to the Comintern was one of apprehension and concern: "The Great Red Scare." Looked at historically, an amused response might have been more appropriate. Nevertheless, the Comintern was an interesting experiment and a fascinating institution. The

three volumes reviewed above have a certain fascination of their own in demonstrating how an historical occurrence can be discussed and evaluated from different ideological positions, and from divergent bases of intellectual preparation.

JOHN W. STRONG
Carleton University, Ottawa

Regionale Verflechtung der Bundesrepublik Deutschland: Empirische Analysen und Theoretische Probleme. By the Forschungsinstitutes der Deutschen Gesellschaft für Auswärtige Politik, e.V. Bonn, Band 33. (München: R. Oldenbourg Verlag, 1973. Pp. 311, DM 34.00.)

One of the remarkable phenomena that attended the emergence of the Federal Republic of Germany (BRD) has been the resurgence of interest in international politics and economics. Long before the *Wirtschaftswunder* started to take effect, associations and societies concerned with international affairs, foreign policy, and related matters mushroomed in Germany. Some of these attained national repute. The *Deutsche Gesellschaft für Auswärtige Politik,* in particular, became internationally renowned. Indeed, its right arm, the Research Institute has become an outstanding source of reference in the study of international politics.

The book under review, the Institute's latest accomplishment, consists of twelve essays produced by a variety of authors. The collective enterprise was initiated by Waldemar Besson, well-known for his expertise in and publications on the Federal Republic's foreign policy. The untimely death of Besson, a few years ago, did not cause the ambitious project to founder. By then workshops had been established in which a number of highly qualified political scientists and political executives were to participate. Although care was taken to blend the theoretical and practical approaches, the executive group (generally those who face the day-to-day problems resulting from the BRD's involvement in regional organizations) contributed disproportionally to the undertaking. The list of executives participating in the workshops included names well-known to the German public such as Katherina Focke, Ellinor von Puttkamer, and Per Fischer. Their contributions, however, have in a sense remained invisible because the task of formulating the results of the workshops was often left to lesser luminaries. Also, one cannot help thinking that the executive group should have been balanced by the inclusion of scholars who through their writings made clearly visible imprints on the discipline. One wonders why Heinrich End and Uwe Nerlich were not included in either panels or papers. Even more curious is the omission of Dr. Helga Haftendorn, who was associated with the Research Institute for several years, and who has recently established herself as a foremost authority in the field through her monumental book *Abrüstungs- und Entspannungspolitik zwischen Sicherheitsbefriedigung und Friedenssicherung.*

The mix of "officials, politicians and theoreticians" (as Reinhard Lohrmann classifies the contributors in a brief foreword) has naturally affected approach and performance. Diversity and unevenness invariably attend collective intellectual endeavors, but in this instance the problem might have been overcome to some extent had a general editor been made responsible for structuring and disciplining the *Schriften.* Since no one appears to have assumed that role, the essays vary widely in theme, tenor and treatment. Thus Erwin Häckel's essay that immediately follows the Foreword is highly theoretical, attempting to arrive at a conceptualization of regional alignment (the latter term, rather than *entanglement* would seem preferable, at least in this context, as a translation of *Verflechtung*). One may not always agree with Häckel. The assumption, e.g., that regional organizations may be viewed as useful and necessary vehicles in the development of world unity has been thoroughly eroded by recent experiences, and is certainly no longer as prevalent as its *auctor intellectualis* (Etzioni) maintained at the time (p. 31).

However that may be, Häckel represents Academe *in optima forma.* The essay on the European Communities and the Federal Republic of Germany which appears to concentrate on the *Verflechtung* (in this instance to be translated as *integration*) of the national and the community policies, conveys the view of an official, and perhaps also the official view. The author, Dr. Ulrich Everling, at the time of writing a top official of the Federal Ministry of Economics and Finance, bases his arguments by and large on German source material, some of it included in articles which he himself contributed to scholarly journals.

The *Schriften* thus explore the position and the commitments of the *Bundesrepublik* in their regional context. They by and large address themselves to the assets and liabilities resulting from NATO- and EEC-membership, the intricacies of the *Bundesrepublik*'s position and its relation to its partners. The American reader in particular will be intrigued by the

German perception of the organizational politics of defense. Then again, he may be struck by the fact that no mention at all is made of the important policy differences between the USA and the BRD, particularly during the Kennedy administration when the relationship between Germany and its allies had virtually reached its nadir. The philosophy behind burden sharing (the *Leitmotiv* during the Nixon years) is also analyzed from the German perspective (in Wilfried Hofmann's essay, pp. 143–65).

Finally, one has to bear in mind that although a timely analysis of the *Bundesrepublik*'s involvement in regional organization must be applauded, its usefulness may be limited in terms of time. Perhaps one should not exaggerate the built-in obsolescence of contemporary assessments; but the new Europe changes fast, and any analysis of any aspect of its structure may appear dated within a few years. To mention but one example: most of the preparatory work of the *Schriften* had been conducted before the Europe of Six changed into a Europe of Nine. What relevance, one must ask, do the problems of the former set have to those of the latter?

In sum, the present volume is destined to remain relatively obscure in the United States. As things stand, it appears unlikely that German and American scholarship will experience a *Verflechtung* that would make the book required reading in graduate course work on this side of the Atlantic. Its contents will not make waves, its sources (unfortunately, the volume lacks an index as well as a bibliography) are not likely to be cited in future papers or brandished at future conventions. This is unfortunate because a book that has been the fruit of so much specialist effort deserves a better fate.

HENRI J. WARMENHOVEN
Virginia Commonwealth University

Foreign Affairs and the Constitution. By Louis Henkin. (Mineola, New York: The Foundation Press, 1972. Pp. 553. $11.50.)

In *Foreign Affairs and the Constitution* Louis Henkin seeks to fill a void of long standing. He maintains that while there have been distinguished studies of presidential or congressional power in foreign affairs, they permit "only peripheral vision . . . of the rest of the scene" (p. ix). Quincy Wright gave a broad overview in his work, but new considerations have arisen in the half-century since it appeared. Failure to fill the void stems from the notion that constitutional law counts for little in foreign affairs, the fact the Court has said little in the area, etc. In his mind the effects are costly, for although the role of politics in foreign affairs is ample, the politics itself is often shaped by the Constitution.

Mr. Henkin argues that the "abiding uncertainties" turn on the distribution of political powers between President and Congress "singly and together, in conflict and cooperation" (p. 10). Other areas also generate constitutional questions: international organizations, the role of the states and courts, individual rights. Let us say a word on his discussion of these lesser areas of controversy before we turn to his analysis of the greater.

America's participation in international organizations has posed no significant difficulties in Mr. Henkin's view. Obligations fall on the American government, not individual citizens. The government is under no *constitutional* obligation to honor any treaty. Should future participation impinge directly on individuals within the United States new constitutional issues, without precedent, would arise.

Mr. Henkin holds that judicial review, which has had a small role on questions of states rights or Separation, and a more substantial one on individual rights, "has flourished as the courts have staunchly upheld the supremacy of treaties and of acts of Congress or of the President over inconsistent state action" (p. 210). He gives a lucid exposition of the *Sabbatino* case, with its implication for Act of State doctrine and determination of international law for the states.

He feels that federalism showed its limitations in foreign affairs long before it "began to be a wasting asset in American life generally" (p. 228). Problems arise, for example over the distinction between the Treaty denied the State and the Agreement or Compact, with Congress's consent, allowed it. Mr. Henkin's main theme is the limitations of state power, as under the Commerce and Supremacy Clauses, and the additional restraints implied in *Zschernig* v. *Miller*. He believes, nevertheless, in the "abiding relevance of federalism" derivative in part from constitutional, in larger part from political, considerations.

In the final area of lesser controversy, the author stresses that Mr. Justice Sutherland exempted foreign affairs "from the rigors of limitations on delegation inherent in the separation of powers" in *Curtiss-Wright*, but affirmed the applicability of other constitutional limitations. Their vitality is evident in cases which turn on individual rights, e.g., the bearing of due process on the right to travel abroad

or of "just compensation" on more generous leeway for the Court of Claims in instances of "taking for public use."

The major areas of controversy with which Mr. Henkin is concerned stem from the fact that in domestic affairs the constitutional consequences of Separation are more or less agreed; in foreign affairs they are determined by no "natural" division. "As they have evolved, the foreign relations powers appear not so much 'separated' as fissured, along jagged lines indifferent to classical categories of government" (p. 32).

The most jagged of these lines is that between the "President's conduct of foreign relations, including the use of force for foreign policy purposes, and the power of Congress to declare for war" (p. 100). However, as a "matter of constitutional doctrine" the President "begins to exceed his authority only if he wilfully and recklessly moves the nation toward war, and a responsible President, loyal to his constitutional oath, should stop, or seek the authorization of Congress" (p. 100). Happily "that constitutional issue is becoming hypothetical for it is increasingly difficult to make an authentic case that the President has taken the country into war without Congressional authorization in advance or ratification soon after" (100–101).

Under Mr. Henkin's analysis it is less the constitutional issue that is likely to become hypothetical than the ability of Congress to make effective its constitutional responsibilities. Once any considerable number of Americans is engaged in military action through presidential initiative, Congress may find itself faced with a Hobson's choice if it seeks to exercise its check by reduction of appropriations or through disengagement. The attempted exercise of constitutional responsibilities in the former instance risks imposition of unbearable burdens on America's fighting forces; in the latter it is undermined by the inability of a state to terminate conflict through its sole initiative.

"A President can insist that the 'line' between war and foreign policy by means short of war is the constitutional imperative delimiting his domain from that of Congress," Mr. Henkin asserts. But this hardly resolves the dilemma. Is the President true to his oath when he draws that line as broadly as he deems necessary, barring explicit withdrawal of congressional support, or is he under obligation to draw it strictly, through the changing phases of its exercise, in the absence of specific congressional authorization? Here Mr. Henkin's clarity in formulation of the issue is not matched by clarity in its resolution.

In his conclusion the author rightly discounts proposals that seek remedies through drastic amendments or the denial of power, and puts his emphasis on more effective legislative-executive *modus vivendi et operandi* and the more balanced exercise of power.

Mr. Henkin's book makes a notable contribution to the task of building a new national consensus in foreign affairs, as much by its tone as by its terms. Its hallmark is concern to weigh competing claims with scrupulous care. In lucidity, comprehensiveness, and thoroughness, it offers rich resources to us all.

WHITTLE JOHNSTON
University of Virginia

The Nineteenth-Century Foreign Office: An Administrative History. By Ray Jones. (New York: Humanities Press, 1971. Pp. 224. $11.00.)

This is a contribution to the history of the British civil service. The main themes addressed are the division of labor within the Foreign Office between intellectual and mechanical work; the devolution of work from the under-secretary to the junior clerks; and the regulation of admission to the service by competitive but limited examinations. The changing responsibilities and status of the posts within the hierarchy are chartered and explained, including the decline of the Chief Clerk and the Parliamentary Under-Secretary. The importance of having been Private Secretary to the Foreign Secretary in connection with rising to the position of Permanent Under-Secretary is incidentally brought out, as is the hold of the Private Secretary on appointments and consequently on the character of the Office. There is a useful appendix and, in chapter 2, some tables, providing biographical information about Clerks recruited between 1824 and 1906. All the relevant material has been used, some of it for the first time, and the bibliography is particularly well presented.

The picture that emerges is of a rather inbred institution with a distinct sense of identity, highly conscious of the differences between it and other departments and determined to maintain them; of a body of men making from time to time adjustments to their working routine which kept the Office always slightly behind the times. In this perspective, reduced in many respects to its proper proportions, the Foreign Office is revealed as concerned less with *la*

haute politique than with administering itself, and as engaged in a rearguard action lasting fifty years to withstand the leveling influence of a Treasury determined that the F.O. Establishment should cost the country as little as possible and consistently refusing to countenance increases in personnel simply because the volume of business was otherwise unmanageable. The impression given is that the Foreign Office was there, like the cavalry in war, to give tone to what would otherwise be an unseemly brawl.

The author is not concerned with the impact on foreign policy of the developments he describes. He assumes too much when he says (p. 143) that foreign policy was formulated within the administrative arrangements he has investigated. It is doubtful whether this was the case even after the Reforms which took effect from 1 January 1906 and for which Lord Lansdowne and the "old guard" of Sanderson and Villiers here get the credit they deserve. As it is, no symbolic value is attached to the fact that the Cabinet ceased to meet in a room in the Foreign Office late in 1856. Nevertheless, this is a valuable work of reference, to be placed alongside the Foreign Office Lists. Many historians will have reason to be grateful to Dr. Jones for his work in this field.

KEITH WILSON
University of Leeds, England

The Rationale for NATO: European Collective Security—Past and Present. By Morton A. Kaplan. (Washington, D.C.: American Enterprise Institute for Public Policy Research and Stanford, California: Hoover Institution on War, Revolution and Peace, 1973. Pp. 94. $3.00, paper.)

The first half of the book deals with the origins and early developments of NATO. On the whole, this part is a well balanced, level-headed analysis of American and Soviet post-war policies with an emphasis on the French-German dichotomy and its impact on US relations to Europe.

One would also agree with Professor Kaplan in his assessment of NATO's problems in the 'seventies. While the Soviet Union and its Warsaw Pact (WTO) allies keep increasing their military capabilities in an apparent preparation for a blitz-like, hard and sudden strike against the West, the NATO countries stick to their old-time strategy of a defence based on gradual mobilization and a slow conventional build-up.

There is also logic reasoning in his proposition that if the countries in the West are unable to respond quickly and effectively to a blitz-strike from the East, they should look for ways to slow down the delay and thus gain time to mobilize.

Doubts and objections start cropping up, however, when Professor Kaplan proceeds to discuss the practical measures which he recommends to implement his dissuasion strategy. Partly to avoid a Soviet first strike on nuclear sites, partly to convince the East Europeans that NATO would not hit back at the US and its national territories, Kaplan feels that the United States should withdraw its 250 Pershing missiles for tactical nuclear delivery from Central Europe. He also feels that the quick reaction aircraft (QRA) designed for nuclear strikes, should be withdrawn. As a compensation he suggests "a more credible linkage" of the Polaris/Poseidon nuclear forces and a further development of USA's quick-transfer capability.

First, given the present Soviet military deployment in Eastern Europe, one wonders how the Warsaw Pact allies could feel assured that a NATO response would hit Soviet forces only, with no damage to their own territories. Moreover, although the WTOs might prefer to sit on the sidelines in a NATO-USSR confrontation, it seems very unlikely that the Soviet Union would allow them to do so. So far from growing looser, the Soviet grip on its Eastern European allies has become harder and firmer since the Czech crisis in 1968, partly through a de facto acceptance of the Brezhnev doctrine, partly as a result of increasing Western weakness and growing Soviet strength.

Second, while the suggested withdrawals probably would leave the WTOs undissuaded, their effect on US's West European allies might be quite serious. The rationale for NATO—as they see it—is to provide a credible US support to the defence of Western Europe. Their long-standing worries about a substantial reduction of US troops in Europe have been further augmented by such detente measures as SALT I, which made many of them question the long-term validity of America's strategic deterrence. Should the local nuclear deterrence also be weakened by a withdrawal of major means for tactical nuclear delivery, the West Europeans might see it as another indication of a gradual US "thinning out" process in Western Europe.

One traces in this book a perception of Europe, which though widely shared, may not reflect the situation. The West Europeans may

comply with American withdrawal policies such as those suggested by Dr. Kaplan, but the long-term psychological effect on their evaluation of the US as a European mainstay may prove more important than the short-term gains from limited withdrawal arrangements. In this, as in many other respects, his book provides a useful illustration.

NILS ØRVIK
Queen's University, Ontario

Vietnam: The Origins of Revolution. By John T. McAlister, Jr. (Garden City, N.Y.: Doubleday Anchor Books, 1971. Pp. 365. $2.95, paper.)

This work adds to John T. McAlister's consistently provocative analyses of the political underpinnings of the two Indochina wars. His previous penetrating studies provide essential background to the development of conflict in Indochina, including research on the complex non-Vietnamese highland ethnic group struggle permitting the Viet Minh to develop a small military capability and leading to the French defeat at Dien Bien Phu. In the present work, McAlister has written the foremost statement in English on the significance that World War II, and especially the Japanese role during and immediately following that war, had upon later events in Indochina. Excellent scholarship utilizing documents previously exploited by only a handful of scholars results in a search in depth for typically underrated influences. Sources include the rarely mined Service Historique de l'Armie (French Army Archives), limited publication editions of Sureté General studies and of World War II British and American foreign offices, materials of the prominent French scholar on Indochina, Paul Mus, and a wealth of relatively fugitive French sources.

Although revolution is the theme and the presentation is succinct, the history Professor McAlister has written is also comprehensive. He considers such important influences on the origin of revolution as the historical background of precolonial Vietnam, the colonial experience, the impact of the World War II Vichy and Japanese interregnum, and the British and Chinese occupation period. Of considerable interest are his treatments of vastly complicated internal Chinese politics as they affected the Viet Minh; the role of various Vietnamese political parties, sects, and personalities who fought both the French and the Viet Minh in the mid-1940s; and the sociological, economic and military situation in Vietnam on the brink of the First Indochina War. McAlister also analyzes the incidence o the August revolution, compares the revolu tion in both the North and South after th Japanese surrender, and unravels the intricacie of internal French politics during the period The complexity of Vietnamese history is amply documented by the facts McAlister provides on Japanese assistance to the Viet Minh, including weapons, weapons production, and cadre training, as well as their aiding and building southern anti-Viet Minh military and paramilitary forces. This aspect of the presentation is an invaluable guide to the innumerable interconnections among political groups in Vietnam which so greatly influenced the Indochina wars.

McAlister includes discussion of numerous significant events including the Japanese coup de force, the allied victory over Japan without invasion of the Indochinese mainland, the decision permitting Great Britain and China to occupy along prescribed territorial lines, the death of President Roosevelt, the rape of the economy of the North by the Chinese and decisions of Chinese warlords permitting the Viet Minh to survive, and China's policy of accepting concessions from the French.

Yet having described numerous influential events beyond control of the Viet Minh, McAlister presents conclusive evidence that successful revolution is not the result of chance. Utilizing his mass of data, he analyzes the Viet Minh's genius for organization, its superiority over competing indigenous political groups, its ability to compromise with the French even at the risk of internal dissension, and its tenacity in the long period of rebuilding in the highlands.

Although the history in *Vietnam: The Origins of Revolution* stops with the beginning of the First Indochina War, the seeds of all later fruits of success, failure, and ultimate triumph for the Viet Minh are here. While undoubtedly nothing can be considered inevitable in predicting the course of a revolution, the characteristics McAlister ascribes to the Viet Minh greatly explain its long-range success as a revolutionary force.

CHARLES A. JOINER
Temple University

Common Market and American Antitrust: Overlap and Conflict. Edited by James A. Rahl. (New York: McGraw-Hill Book Company, 1970. Pp. 476. $32.50.)

This is Volume 4 of the European Common Market Antitrust Project of the Special Committee on the European Common Market of

the Association of the Bar of the City of New York (Breck P. McAllister, Chairman). The first three volumes covered business regulation in the original six common-market nations; this one explores the interface between the antitrust laws of the Communities and of the United States. Nobody with a sense of history can be indifferent to the parallels between the two systems. In the United States, after the Civil War, markets expanded as trade barriers were lowered by the railroads, and so also after 1957 in Western Europe as manmade barriers came down. In each case, competition became more intense, and inefficient firms were hard hit as hitherto protected enclaves were invaded. One result was the Sherman Antitrust Act of 1890. When the European Communities were established, the connection between the wider ambit of trade and the maintaining of competition was obvious, and the Treaties wrote it into their organic law. Thereby, they assumed the same problem of jurisdiction over corporations affiliated to or dependent on sovereign states outside their own boundaries.

The foreign impact of American antitrust is an old story which has attracted able scholars into a difficult area: "For a field which has witnessed so much litigation, this one unfortunately has been relatively unenlightened by expositions in the formal opinions themselves . . . " (xii).

The book first sketches the history of the Communities and the general objectives of securing the benefits of free trade. (It is sad to reflect how ready were all members in late 1973 to dishonor the article providing for unimpeded movement of goods, when they prevented oil shipments to the Netherlands.) The conflict between economic planning and competition proved to be less difficult than the extent to which the Community law was supreme and could therefore override national law where it was more or less restrictive. There follows, logically enough, a very useful summary of the abiding issue—antitrust laws, Violation may result from acts no matter where committed, but must those acts be a direct restraint on United States trade and commerce, or does any substantial restraint, however indirect, suffice? Either way, one needs an economic analysis to see whether any effect exists. The authors are curiously noncommital about the ruling on Minnesota Mining and Manufacturing Company (92F Supp. 947 [D. Mass. 1950]) which, in effect, says that investment to manufacture abroad rather than at home would be a restraint, illegal if done as part of any kind of combination. The treatment of extraterritorial jurisdiction of the Communities is of course more conjectural, since the record is so much shorter.

The extraterritorial procedure and enforcement are examined in considerable detail. The well known Dyestuffs case was, at the time of writing, still on appeal to the European Court of Justice, which has subsequently affirmed (2 CCH Common Market Reporter Paragraph 8169 [1972]). The ECJ, in addition to moving toward the American stress on patterns of conduct implying conspiracy, seemed to me to hedge or limit the sweep of the Commission decision which "constitutes assertion of personal jurisdiction over alien firms on grounds which appear to be as broad as, if not broader than, those relied upon under American law" (137). In effect, the ECJ found that the parent firms outside the Common Market were really there through their subsidiaries, so that the problem was unreal anyway. I suspect that the authors of this work would be less than satisfied with the ECJ decision. In any case, the detailed survey of conflict in chapter 4, although impossible to summarize, well repays a reading. Restraint of competition by government enterprises, in theory subject to the antitrust laws, in practice an object of official and public solicitude, is a sleeping giant. The most celebrated conflict over antitrust jurisdiction, however, has involved neither the Common Market nor government enterprises but the Swiss jeweled watch industry, in combination with the American. The Swiss government opposed the Department of Justice in the American courts with unprecedented vigor and lack of restraint. They lost on liability but probably succeeded in moderating the relief. Efforts at international consultation, notification, and more rarely actual cooperation, are few and not impressive, yet the need is so apparent that the attempt will stumble on.

The book is an impressive treatment of a difficult and almost unbearably complex subject; the authors manage to be exhaustive in their treatment without losing the thread of logic. Twenty years hence, much of the content will be outmoded, yet it will have been replaced only interstitially, like an animal body renewing itself.

M. A. ADELMAN
Massachusetts Institute of Technology

Politics of Central Asia. By Ram Rahul. (New York, Barnes & Noble Books, 1973. Pp. 183. $9.00.)

This is a survey of penetration of Central Asia (the area defined in broad traditional

terms) by the great powers, with China, Russia, Britain, and India as the main actors. The title is thus a misnomer since the book does not really deal with the politics of local states. Written by an Indian scholar, it offers new insights, but it is disappointing because it is more descriptive than analytical and is based almost exclusively on secondary Western sources. Two appendices list agreements between the People's Republic of China (App. I), the Soviet Union (App. II), and the border states.

The main part of the book is devoted to a blow-by-blow account of treaties and agreements marking boundary settlements. Described segment by geographic segment, the history of each piece of boundary is carried through from earliest entries to the present. Rulers, agents of foreign powers, topographic landmarks, and place names pass in front of the reader in a somewhat confusing kaleidoscope; there are no maps to help. Leaders of Central Asia's two great religions, Buddhism and Islam, are singled out for special treatment in two chapters. In an interesting account, *lamas* and *mullahs* are seen as defenders of local interests, but frequently also as instruments of foreign penetration; in modern times they serve the aims of cultural and peace diplomacy of the two powers now dividing the region: the Soviet Union and China.

From the Indian vantage point, the author offers a special perception of the relative role played by the two powers. In their contest for primacy in Central Asia, the Soviet Union is seen as the stabilizing influence and a benign power. China is the aggressor, its efforts to extend influence in contiguous regions being seen as a prelude to disaster: "China is not only claiming territories in Soviet Central Asia, . . . but also trying to secure the secession of the Soviet Central Asian republics . . . thereby destroying . . . the very basis of the Soviet Union — a union of peoples of many races and creeds. . . . Not only has China now crossed the man-made Great Wall . . . but it has also essayed the great walls erected by nature itself — the Altai, Himalaya and other mountain ranges. . . . Its conflict with the [Soviet Union] has . . . profound implications for all mankind. [It] . . . may result in a great cataclysm" (pp. 130–131).

Notwithstanding the past imperialism of the Tsars, the Soviet Union is not regarded as an imperialist power. Since 1917 it has "finally turned its back on imperialism" (p. 97), a statement which flies in the face of obvious evidence. The author himself cannot sustain the logic of his argument in the discussion of the Soviet policy towards southwestern neighbors. He is sympathetic to the Soviet Union's ambitions to extend influence into Turkey, Iran and Afghanistan, "the area of its aspirations" (p. 91), but states that Russia's general policy in that area "has always been to attach and/or draw them to itself," the goal pursued now by diplomatic rather than military means (p. 89). He feels that the three countries no longer fear Russia (p. 14), but acknowledges nevertheless, that the Turks still "passionately believe that the Soviet Union is bent . . . on either annexation or domination" (p. 92). The section on Iran, incidentally, totally omits the 1945–46 Soviet occupation of northwestern Iran, the narrative moving directly from 1927 to 1945 (p. 84). Available evidence also makes doubtful some other assertions, such as that the Soviet Central Asian republics enjoyed full autonomy in the nineteen twenties (p. 14), or that the formation of an "independent People's Government of Mongolia" and its pro-Soviet orientation, have been a matter of entirely free choice (p. 13).

In the assessment of the role of China, the author's concern, naturally enough, centers on the threat to India's security. He feels that the PRC pursues the old concept of the "Central Kingdom" which comprehends no other relationship with the border states than that of "suzerain-vassal" (p. 39), that it feels it "has the moral right to claim any territory that had at any time been the part of its empire (p. 15), and that "China's present more-than-mere border confrontation with India [is] to get India to acquiesce to China's power complex in Asia" (p. 39). In this light India's policy to extend protectorate over Himalayan border states (an extension of the old British policy), is seen as a legitimate pursuit of national interests.

The book does not offer new factual information or analytical insights, but it can be assumed that its obvious pro-Soviet and anti-Chinese bias is shared by a number of Professor Rahul's fellow academics (he heads Central Asian studies at the University of New Delhi) and Indian intellectuals. For this reason it is of interest to an American reader.

TERESA RAKOWSKA-HARMSTONE
Carleton University, Ottawa

The Analysis of International Politics. Edited by James N. Rosenau, Vincent Davis and Maurice East. (New York: Free Press, 1972. Pp. 397. $12.95.)

To honor Harold and Margaret Sprout, the editors have assembled eighteen essays by as many authors. They suggest that these essays bear in a variety of ways on major themes in the work of the Sprouts—the linkages between domestic and foreign policies and politics, the changing nature of the international system, the role of science and technology in international affairs, the contribution of comparative foreign policy studies, the role of ecological factors, and the making of military policy.

The papers by and large do not primarily seek to test or criticize the work of the Sprouts. The papers can usefully be viewed as a collection of snapshots of the state of international relations studies and the state of mind of some leading scholars in the late 1960s and early 1970s. They reflect the earlier divisions and issues in the field, early signs of work which has since been developed substantially, and attempts to come to grips with the issues raised by the Vietnam War and the domestic protest it engendered. Many of the authors reveal rather candidly their own continuing search for a general intellectual and philosophical posture toward the study of international politics.

Before turning to some general impressions suggested by these snapshots, it is important to note that at least four of the essays provide significant substantive contributions in their own right. Richard Falk treats the relationships between the superpowers and proximate zones they dominate to suggest structurally different ways of thinking about international relations. Dina Zinnes systematically uses quantitative studies to test for relationships among the external environment, perceptions on the part of decision makers, and foreign policy actions. Chadwick Alger draws on multiple methods to measure and elucidate the effects of public debate, negotiation between and among regional groups, and delegate interaction on the progress of the U.N. General Assembly toward consensus. Maurice East exploits aggregate data for the 1948–64 time period to clarify on a systemic basis the relationships between discrepant economic positions and prestige among nations and the incidence of international violence.

What general impressions do the papers leave? First, they suggest in many cases a recognition of the inadequacy of radical simplifications. Charles McClelland notes and welcomes a shift away from an ungrounded, umbrella theory in a systems metaphor. J. David Singer rejects assertions of a lack of cross-over in the work of those styled as theorists and others styled as empiricists. He also challenges assertions that analysts of international politics must choose between the pursuit of normative concerns and of formal science. Morton Kaplan argues rather elegantly that both those who would treat international politics as deterministic and those who would treat it as random deprive man of the freedom to act purposefully to affect international outcomes. While he disposes of the argument that the degree of predictability of international politics is the negative of the degree of freedom, he does not promote the conception of foreign policy as "one of decisions based on simple rules to control a deterministic world" (p. 103). Instead he suggests that international politics and policy must be thought of as a very complex matter in which numerous semi-autonomous actors strive to achieve some sort of regulation based on a combination of freedom and constraint. Charles Hermann contends that the analysis of foreign policy cannot appropriately be seen as equivalent to the analysis of capabilities. And Klaus Knorr usefully complicates the notion of capabilities by pointing out the fallacies of pretending that capabilities are certain, are mensurable in the absence of some stipulated objectives and contingencies, and are solely confined to military attributes. Attempts to simplify the set of attributes of nations fare no worse than attempts to simplify the set of actors in international politics. Oran Young makes a strong case for the importance of actors other than the nation-state and argues that failure to consider these other participants distorts analysis.

One is struck by the sense of openness and re-assessment these themes convey. But one is also struck by how much they reveal (1) a continued pre-occupation with chronic intellectual issues that are inherently unresolvable and (2) a lack of consensus on the basic elements with which the analysis of international politics ought to deal.

This lack of consensus seems to be compounded by a lack of useful operationalizing of the basic concepts thrown about in the literature of international relations. For example, James Rosenau asserts that experts do not know how to conceptualize the notion of "environment," and Charles Hermann comments on the difficulty analysts have in thinking clearly about what they mean by foreign policy. Burton Sapin calls attention to an inability to define the elements of foreign policy performance. The conceptual foundations seem particularly weak when one seeks starting points for efforts to evaluate and design international policies and political institu-

tions and national foreign policies and foreign policy institutions.

The reflections of several authors on attempts to move directly to empirical studies in order to facilitate resolution of conceptual difficulties are discouraging. Ernst Haas makes the point quite clearly that numerous empirical studies on the sources of internal conflict yield only a hodgepodge of results. Dina Zinnes finds that a largely different set of studies on the relationships between domestic and international attributes and between perceptions and actions yield only mixed results in the absence of systematically introduced alternative conditions.

Complicating the field of international politics, recognizing the needs for refining basic concepts, and calling for more multidimensional conceptual frameworks to guide empirical work amount to asserting that analysts of international politics need to make much more demanding choices in the formulation of their questions and priorities.

Do the papers suggest what some of those choices and priorities should be? Bruce Russett in his call for macroscopic analysis of the factors that limit political choice and consequence, presents one set of suggestions. He argues that broad social, economic, and technological characteristics of international politics and the participants in it matter more than the microscopic features of politics and decision making. Hermann would disagree. Neither proposes a set of empirical steps to resolve the dispute or, more reasonably, to clarify the information gain, be it for prediction or explanation from differing mixes of the two sorts of analysis.

Finally, the papers are interestingly sparse in their policy implications. Russett does argue that the importance of his "nonpolitical" variables and the gross stabilities they suggest warrant skepticism about interventionist foreign policy and imply that occasions for foreign policy decision are often best met by abstention and delay rather than by assertive actions. Yet he does not deal with dilemmas raised by the presence of other assertive participants in international politics and the need for coordinated abstention. Raymond Tanter claims that forecasting based on causal analysis can be applied to international politics but supports his argument mainly with examples of forecasting activities rather than instances of intellectually soundly based forecasts. While Russett says that even solely inductive forecasts can be helpful, he notes their vulnerability to gross changes in the international system. Sapin admits our inability to determine what difference one rather than another kind of foreign policy machinery makes for foreign policy performance. And while Vincent Davis is critical of McNamara's managerial style with regard to Vietnam, he does not convincingly demonstrate why a different style would have mitigated that disaster.

The analysis of international politics is clearly as rich and diverse as the Sprouts have long contended, and it offers ample opportunity for creative work. Yet there is little indication that the field has evolved a coherent intellectual orientation capable of producing either strong theory or particularly soundly based policy predictions and prescriptions.

DAVIS B. BOBROW
University of Maryland, College Park

International Institutional Law: Vol. I, Structure; Vol. II, Functioning and Legal Order. By Henry G. Schermers. (Leiden: A. W. Sijthoff, 1972. Vol. I: Pp. xxiv, 303. DF1. 53.00; Vol. II: Pp. xvii, 487. DF1. 82.00.) 82.00.)

This book is a substantial contribution to an emerging area of study which includes the constitutional and administrative law of public international organizations. Unlike the previous literature in that field it is a comprehensive treatise based on comparative study of many organizations and covering the whole range of normative material on their status, structure, and functioning; earlier work concentrated either upon a single organization or upon comparative study of a single topic. Professor Schermers, the Director of the Europa Institute of the University of Amsterdam and of the postgraduate International Course on European Integration, has previously published in Dutch a comparative study of the specialized agencies affiliated with the United Nations (*De gespecialiseerde organisaties, hun bouw en inrichting*), upon which he has built in this more comprehensive treatise.

The range of topics seems adequately to cover "institutional" law, but there will certainly be disagreement about the adequacy of the treatment of some topics. The legal status, and the privileges and immunities, of international civil servants, as well as the vexing issues of their sometimes conflicting national and international loyalties, may well deserve examination in greater depth. Volume I begins with a classification of international organizations and properly excludes from further consideration the private organizations (i.e.,

nongovernmental organizations and international companies). It then examines the character and conditions of membership in public international organizations; and the organization, functions, and powers of their governing organs both representative and professional, considered from the standpoint of policy-making, control, and judicial functions. Volume II begins with a detailed analysis of the decision-making process in international agencies, including the methods of voting and the rules for entry into force of decisions. It then proceeds to financing and budget making. Finally it examines the legal order of the organizations as determined by their constitutional instruments and general international law, and the consequent internal and external status of agency regulations. One chapter presents the limitations of the international legal personality such organizations are considered to possess. There is a full treatment of the interpretation of basic instruments and of the resolution of disputes about their interpretation, followed by examination of the means available for enforcement of the rules of international agencies through supervision, sanctions against member states and individuals, or use of the legal machinery of member states. Possibilities of increased coordination of agencies are discussed, and their external relations examined primarily in the context of the basic framework of treaty relationships which supports them.

Professor Schermers's basic assumption is that a body of international common law relating to the status, structure, and functioning of public international agencies is emerging from the common elements in their constitutional interpretation and practice, and that this common law can be formulated on the basis of a comparative study of that practice. He has performed a very great amount of spadework in bringing together the necessary materials, inserting into the text in fine print hundreds of examples drawn from the practice of organizations which illustrate the points under discussion, with footnote references to the documentation. He has also provided in Volume I a useful 18-page bibliography of works discussing these organizations. As a systematically organized repository of source materials for the comparative study of international organizations, the work will be invaluable to teachers and students whatever they may think of its success as an exposition of a body of international common law.

Professor Schermers has not very explicitly examined the theoretical basis of this common law. It would seem that since the competencies of public international organizations are determined by the basic treaties which serve as their constitutional instruments, any common law of such organizations must arise from the explicit authorization or with the tacit consent of the member states and may become general or particular international law as those organizations enjoy comprehensive or only limited state membership. The materials show that when questions arise on which the constitutions are silent, interpretation has filled the gaps by resort to general principles of law and borrowings from the practice of other organizations; hence there is evidently an assumption that the member states assent to the use of such sources in developing institutional law.

Although Schermers does not elaborate such a theoretical framework, he assumes it, for he provides abundant materials about the relationships of public international agencies among themselves and with their member states. But the picture which emerges from these materials is not a tidy one. As he points out, both the member states and the governing organs of the international organizations interpret the legal status and competencies authorized by basic instruments, with the result that differences of construction occur. There is not as yet much provision for formal resolution of such differences by institutional apparatus. When cooperative attitudes exist (as they generally do in international administrative agencies, where political issues are less sharp than in the multifunctional organizations), informal resolution is often possible. But in the face of sharp differences the position of member-states can be intractable and can force adjustment by the organizations. Since the attitudes of member states are far from uniform, this does not make for a steady growth of common law.

The enforcement of legal rules developed by international organizations, which is discussed at length, is also ultimately dependent in many cases upon the legal agencies of the member states. There is considerable variation, however, in the availability of such national implementation and in the effectiveness with which it is applied. Schermers feels that the organizations do have some limited form of international legal personality with defined competencies, and that they can in spite of the difficulties inherent in the present international system gradually increase their effectiveness. He advocates better coordination of the separate agencies, particularly those affiliated with the United Nations, to avoid overlapping

functions, to engage in joint planning and reporting, and to exchange staff personnel. Such coordinated agencies might move toward the development of an international civil service and become more effective instruments for dealing with multi-faceted international problems such as development.

In the organization of his book Professor Schermers has increased his difficulties by casting his net very widely, for he throws together extremely disparate types of organization. Could not one provide a more coherent view of the common law of single-function international administrative agencies, which have a good deal in common in their organization and procedures, than appears when they are bundled together with the complex structures and problems of the United Nations and the European Community? The financial problem of United Nations peacekeeping seems to belong to a different order of things than the financing of such administrative agencies. The practice of the International Court of Justice has little relevance to that of the Court of Justice of the European Communities, still less to that of the Central Commission for the Navigation of the Rhine. At times the comprehensiveness of the treatise results in a stringing together of descriptions of unrelated agencies which obstructs the central purpose—i.e., to extract common elements of structure and procedure.

It is also true that the author rather frequently, when confronted with no very clear evidence of a generally accepted rule or practice, offers his personal opinion about what the practice ought to be. These opinions are certainly welcome as the considered view of a close student of international organization, and they invariably reflect Professor Schermer's desire to contribute to the effectiveness of the organizations. But they seem at times to be conclusions more appropriate in the comparative study of international organizations than in the adumbration of rules of customary international institutional law. They tend to reinforce a feeling that the materials collected do indeed reveal some common principles and practices, but only in a rudimentary stage of development, with considerable lacunae, and with not a few instances of frustration in the face of political forces still working at cross purposes.

These limitations would probably be freely admitted by Professor Schermers, and they do not detract from the solid contribution made by his painstaking work. It is to be hoped that he may find time and inclination to continue to expand his materials in successive editions to keep pace with what is likely to be an expanding field of institutional practice.

Professor Schermers' work is carefully organized, thoroughly documented, and written in a direct, clear style. It is not free from some minor solecisms of diction and grammar resulting from his writing in a foreign tongue, but none appears to obscure the meaning.

CHARLES H. MCLAUGHLIN
University of Minnesota

The Logic of World Power: An Inquiry into the Origins, Currents, and Contradictions of World Politics. By Franz Schurmann. (New York: Pantheon Books, 1974. Pp. 593. $15.00.)

The Logic of World Power is the most exciting and significant study of world politics to appear in recent years. Franz Schurmann, well known for his China studies and for his leading role in the antiwar movement, brings a diverse background effectively to bear in this volume. Schurmann accords a shaping centrality to the Vietnam experience but does not dwell on the policy aspects of the war except to illuminate structural features of American foreign policy and of world politics more generally considered.

Oddly enough, the idiosyncratic quality of the book does not detract from its significance. Schurmann's study provides a comprehensive and original account of how Vietnam policy flowed naturally from the evolving global role of the United States in the period since World War II. It also concentrates upon the interactions among the United States, the Soviet Union, and China, the links between domestic politics and foreign policy especially as illuminated by organization theory and bureaucratic politics, and the causative impact of economic factors and forces upon the interplay of states. In his handling of each of these themes, Schurmann makes sensitive use of his mixture of personal and academic concerns, producing a book that undoubtedly arose as a personal effort to make sense of America's place in the world after the Vietnam debacle. Impressively, Schurmann's feeling for generalization and gift for conceptual clarity transmute his personal quest into a work of lasting scholarly stature.

The book is divided into three principal sections: "Arcana of Empire," an account of the main drift of American foreign policy after World War II up to Vietnam; "Russia, China, and America," an exploration of the shift from amity to enmity in Sino-Soviet

relations in the context of a shared, but diverse, adversary relationship to the United States; "Vietnam," an explanation of ideological and bureaucratic motivation underlying the American involvement, followed by a heavy stress on the political conduct of the war as portrayed in the Pentagon Papers, and culminating in Schurmann's assessment of how the U.S. failure in Vietnam will affect world politics and America's global role in the years ahead. Each section provides a comprehensive interpretation of the issues from an original point of view; each is a separate *tour de force* that is not only brilliant but persuasive as well.

Briefly, Schurmann believes that the United States in the period after World War II moved to assume the mantle of empire that had fallen from a weakened Great Britain. According to Schurmann, the American urge to establish an imperial world order originated with Franklin Roosevelt's vision of a peaceful world system extending the Soviet-American wartime alliance into the postwar world under the aegis of the United Nations. Roosevelt's death in 1944 prevented such a vision from ever being tested; Truman's ascendancy to the presidency coincided with both Soviet anxiety about America's nuclear monopoly and Soviet ambitions in Eastern Europe, thereby producing a new nexus of Great Power conflict. For Schurmann the Truman Doctrine of 1947 embodied the idea of containment in an active, authoritative form, and simultaneously gave birth to an imperial mission of global scope based on maximum control over developments throughout the entire non-Communist world, with the rationale of opposition to Soviet expansion serving partly as pretext, partly as explanation.

From Truman the imperial torch was passed to John F. Kennedy, whose presidency injected a new element of idealism into American foreign policy. In Schurmann's words: "President John F. Kennedy came to power with a grand design to do what Roosevelt had dreamed of: spread a Pax Americana over the entire world which would guarantee security from war, stability for all, and development for the poor. Kennedy's progressivism and his imperialism were inseparable" (p. 419). The dualism of the Kennedy years was typified by two of its most characteristic innovations—the Peace Corps and the Green Berets. American imperial energy was dissipated in Vietnam, where the quest for control was frustrated by revolutionary nationalism and the idealism was tarnished beyond recognition by the practical imperatives of military necessity in a deteriorating situation. Schurmann is not shrill, however, and he appreciates the extent to which the American idealistic impulse was both genuine and appreciated, even in Vietnam. Indeed, it is this realization that makes Schurmann's thesis especially valuable, because he is able to illuminate the way in which the imperial motivation, when effectively challenged by revolutionary nationalism, ineluctably if unwittingly produces barbarous behavior that entails waging indiscriminate and cruel warfare against civilian society.

Schurmann's argument is subtle and multifaceted, but part of the originality of his interpretation is to assign principal responsibility for the imperial outlook to centrist, liberal Democrats rather than to right-wing conservative Republicans. Schurmann also shows that America's imperial posture flowed from a set of internationalist economic concerns connected more closely with the restoration of a world market system than with the narrower goal of American business expansion *per se*. That is, American foreign business activity was encouraged, but at the longer-term expense of the national economy itself, a process suggestive of the earlier overseas flight of British capital. In the end, Schurmann seems ambivalent about the future, believing on the one side that Vietnam crushed the imperialist impulse, and on the other that it may yet reemerge in the form of a new idealistic quest, this time perhaps under the banner of "interdependence."

Beyond this line of substantive interpretation, Schurmann makes a central distinction between ideological politics and interest politics. In this regard the imperial mandate emanated from a broadly based popular consensus that arose initially from the desire of most Americans for a peaceful and decent world, and then was sustained—until the Vietnam failure and détente—by a more negative but essentially similar conviction that American power must be spread broadly to preclude Communist aggression. Within the parameters set by this ideological consensus, foreign policy is shaped by the dynamics of bureaucratic politics and reflects the complex bargaining outcomes of contending governmental and nongovernmental interest groups Schurmann is at his best when he describes the bureaucratic processes through which a government—any government—often finds itself taking contradictory steps in order to neutralize contending coalitions of interest groups. Such a process is familiar to students of the defense budget and arms control, but

Schurmann's achievement is to demonstrate its relevance to *all phases* of the foreign policies of *all governments*. With great feeling for cultural and ideological texture, Schurmann demonstrates that whether one is talking about the policies of China, the Soviet Union, or the United States one is talking about a shared process of intragovernmental conflict resolution carried on in deliberate isolation from public understanding. One is left with the feeling that perhaps the business of government is too shoddy to bring out into the open, even in a country such as contemporary China which Schurmann admires for a variety of well-specified reasons.

As a consequence, Schurmann's book certainly confirms a cynical view of state power, although the policy implications of such a view are nowhere considered in the book. It could be, although Schurmann is nowhere explicit, that the only path to humane governance is by deconcentrating and decentralizing political power, especially in the large states, and by reconstructing local and intermediate institutions.

Of course, one cannot do justice to Schurmann's achievement in a short review. It would be easy to dissent from Schurmann's judgment at this or that point. He often makes controversial assertions without sufficient care or documentation (e.g., that the United States committed genocide in Vietnam or that the atomic bomb was the essential structuring feature in the post–World War II period). Nevertheless, the cumulative effect of Schurmann's line of interpretation is persuasive, and his analysis is always instructive. Whether one agrees or disagrees, one cannot fail to learn. Let me put my evaluation in more professional terms: The next time a graduate student asks which three books in international relations to read for minimal literacy, I will now be able to say in a tone of assurance that one of them must be *The Logic of World Power*. For the other two, there are numerous candidates!

RICHARD A. FALK
Princeton University

The Radical Left and American Foreign Policy. By Robert W. Tucker. (Baltimore: The Johns Hopkins University Press, 1971. Pp. ix, 156. $7.50, cloth; $2.75, paper.)

When a mainstream political science international relations specialist writes a book endorsing, even if somewhat reluctantly and patronizingly, the radical revisionism of the 1960s, the event may be of some note in intellectual history, apart from the intrinsic merits of the endorsement. When five years later another mainstreamer is asked to review the endorsement for this journal, a further stage in assimilationism may have been reached. I imagine this is two steps forward—though arguably, in the meantime, author Robert Tucker may have taken one step backward elsewhere in waving an American big stick about Arab oil (*Commentary*, January 1975, pp. 21–31). Meanwhile also a burgeoning political economy literature about American foreign policy (Thomas Paterson, Theodore Moran, Steven Rosen, James Kurth, and several others, plus additional contributions by stalwarts Gabriel Kolko, Harry Magdoff, and Richard Barnet) leaves Tucker's examples of radical revisionism questionably representative. Nonetheless, Tucker's own points seem still sufficiently pertinent to warrant concentrating a review of limited length on them rather than on their relation to the subsequent evolution of ideas.

Tucker's central point, approached again and again from various directions, is succinctly stated near the end:

> The radical critique has forced us to acknowledge the extent to which an obsessive self-interest has been central in American foreign policy. . . . In its insistence that American diplomacy has been driven throughout by self-interest, the lesson radical criticism conveys is that America has behaved very much as other great powers have behaved, and that if there is a quality unique to American diplomacy it consists in the greater than usual disparity between ideals professed and behavior. This lesson may not have been the intention of radical critics—certainly this was not their primary intention—but its corrective value is not diminished for that reason (p. 148).

Their "primary intention," which Tucker is at pains to reject, is to demonstrate varieties of economic determinism and thus to magnify the repulsiveness of America's selfishness and promote resistance to it by contrasting it (explicitly or implicitly) with the altruism she would supposedly show if her capitalism were replaced by thoroughgoing socialism.

Tucker mistrusts such socialism; and against the economic determinism of those whom he groups, with some conscious procrusteanism, as radicals (principally William A. Williams, Gabriel Kolko, and Harry Magdoff), Tucker accords his own primacy to the balance of

power. Hobbes, Niebuhr, and Morgenthau reverberate throughout Tucker's critique:

> Radical criticism will not confront the eternal and insoluble problems inordinate power creates, just as it will not acknowledge that men possessed of this power are always ready to use it if only in order to rule over others. In the radical weltanschauung there is little, if any, appreciation that dominion is its own reward and that men may sacrifice material interest in order to rule (or, for that matter, to be emulated). There is also little, if any, appreciation that expansion may be rooted in an insecurity that is not simply self-generated (p. 151).

The radicals are right that America behaves selfishly, much more than she imagines; but so do all great powers, capitalist and socialist—a "phenomenon as old as human history," Tucker is fond of repeating, and one most likely to continue, because of age-old defensive pre-emptive aggressiveness and because of common pride and power lust apart from economic gain.

Tucker does not really come to grips with the Marxist problem of the prospects for transforming human personality under socialism; in effect, he dismisses the idea, relying on "human history" and a mildly suspicious interpretation of Soviet experience. Yet the persistence with which he asserts the primacy of security roots over economic roots of action in nearly all periods of international relations and particularly in twentieth-century American foreign policy evinces resolve to preclude the socialist solution while incorporating most of the rest of radical revisionism. Tucker is not content to argue, as I would, that American foreign policy could not have been conducted without *multiple* sources of support: practitioners and influentials whose minds are on security (like Tucker), *and* others whose minds are on profits, *and* others whose minds are on social stability, *and* others whose minds are on bestowing the blessings of Americanization on lesser breeds, and others who . . . etc. It seems to me that the location of leadership vis-à-vis followership (in an analysis at this high level of generality) is no more important than recognizing that leaders are not leaders unless they are somehow attractive to followers. And in my view business interests do at least fit among the sets of followers that are likely to have a long-term contingent veto over American foreign policy whether or not they normally have the initiative in policy making; moreover, fundamental business interests do enjoy some privilege in that American leaders whoever they are have learned an obligation to preserve "the American way of life," which involves mixed economy capitalism. Whose purposes, then, should normally be said to be prevailing becomes a subtle problem of analysis in which it is not clear to me that Tucker bests the radicals he studied. And if socialist consciousness-raising were really somehow able to nullify the prestige of American business, international security-consciousness would indeed remain, but the world would be more changed than Tucker enjoys contemplating.

Another miscue (this time many of the radicals are more to blame) is Tucker's concentration on undercutting the argument that America since 1945 has been aggressively thrusting to achieve a world integrated for capitalism through U.S. hegemony; whereas, it seems to me, the argument most worth considering is that American took over and refurbished the family estate of a world that had already been integrated for capitalism by British and French parents that were now becoming too infirm to guard the family estate themselves. To be sure, there were the British/American and the French/American father/son quarrels that Kolko emphasizes; but Magdoff in effect sees that the family ties were fundamental. From the latter perspective, without having to adopt the Marxist dialectical contradication, Tucker should not find the view that there is now a European and Japanese capitalist "empire by (American) proxy" too "difficult to reconcile with the view that our principal Capitalist allies are also our principal adversaries . . . in the imperialist network" (p. 133).

One might point to other inadvertently slippery encounters in the 1915–65 historical sections that compose much of the book. Yet to overemphasize them would be unfair. Tucker's book is an honest effort to assimilate radical revisionism. It should be welcomed, for it advances the day when contributions of Marxist *analysis* can be freely utilized in research and policy making even by those who firmly continue to oppose Marxist *prescriptions*. Not all American elites will shrink from their own image when they come to see it more clearly along with the image of others worldwide in some neo-Marxist mirror.

A Cricket in the Thorn Tree

Helen Suzman and the Progressive Party of South Africa
By Joanna Strangwayes-Booth
This biography of Helen Suzman, who for thirteen stormy years (1961-1974) was the sole representative of the Progressive Party in the South African parliament, summarizes the history of South African politics in recent years.

FOUNDING PRINCIPLES OF AMERICAN GOVERNMENT

Two Hundred Years of Democracy on Trial
Edited by George J. Graham, Jr., and Scarlett G. Graham
A most appropriate celebration of the United States Bicentennial is a serious assessment of the principles upon which the nation was founded and an investigation of how they have evolved and endured during two hundred years of experience.

POLITICS AND BUDGETING IN THE WORLD HEALTH ORGANIZATION

By Francis W. Hoole
This book approaches the WHO program in policy-making terms and focuses on the political struggle involved in the budgetary process. "[Hoole's] effort to test propositions through computer simulation is most successful." —Aaron Wildavsky
(International Development Research Center, Studies in Development, No. 11)
240 pages $10.00

DON'T MAKE NO WAVES... DON'T BACK NO LOSERS

An Insider's Analysis of the Daley Machine
By Milton L. Rakove
"A fascinating look at how the public's business has been handled in Chicago."—*New Republic*
". . . an authoritative and absorbing history of the Daley machine. . . . a comprehensive and refreshingly fair view of the Chicago organization." —*Chicago*
312 pages, photos paper $3.95 cloth $10.00

THE POLITICAL ECONOMY OF PUBLIC ORGANIZATIONS

A Critique and Approach to the Study of Public Administration
By Gary L. Wamsley and Mayer N. Zald
"Wamsley and Zald have confronted the paradigm problem in public administration by proposing a framework that links the field's traditional concerns with politics and management to organizational sociology. . . . valuable reading for students of public organization." —*American Political Science Review*
128 pages (a reprint) paper $3.50

INDIANA UNIVERSITY PRESS
Tenth and Morton Streets • Bloomington, Indiana 47401

HERE IS A "NUTS AND BOLTS" TEXT THAT REALLY DOES PROVIDE A FULL, FACTUAL, DESCRIPTIVE ACCOUNT OF AMERICAN GOVERNMENT... leaving the instructor free to discuss the deeper questions of analysis and value!

AMERICAN GOVERNMENT
Structure and Process

Michael A. Krasner, Queens College of the City University of New York;
Stephen G. Chaberski, City College of the City University of New York;
D. Kelly Jones, Davidson College

This **NEW** text is a *thorough, concise, objective,* and *lively* presentation of the basics of American national government and politics. For a book of its easily manageable size, it includes unusually detailed information on the actual workings of the presidency, the Congress and its committees, the judiciary, and the bureaucracy, as well as interest groups and political parties. Its comprehensiveness, straightforwardness, and relative brevity make it suitable for a wide variety of course approaches. A major departure from most brief texts is the book's inclusion of a chapter on the media, a case-study on policy making, and a chapter on current issues and trends.

OTHER OUTSTANDING FEATURES OF THIS TEACHING TEXT INCLUDE —

- *Up-to-the-minute results* of the 1976 presidential and congressional elections.
- *Chapter contents* at the beginning of each chapter to facilitate the reader's grasp of the highlights and structure of the discussion.
- Key concepts, organizations, offices, etc., in *boldface* in the text.
- *End-of-chapter glossaries* of the boldface words, aiding the reader's study and review.
- A brief list of suggested supplementary readings for each chapter.
- The *Constitution* in the appendix.
- An *Instructor's Manual* with extensive test questions compiled by **Professor Thomas Scism** of Eastern Illinois University.

New and forthcoming additions to Little, Brown's distinguished Political Science list...

Politics in France

Third Edition
Henry W. Ehrmann

Since 1971, when the Second Edition of this leading study of politics in France appeared, that country has gone through one national referendum, one parliamentary election, one presidential election, and a rather drastic restructuring of its party system. This new Third Edition will help students understand these important events in both their new and old contexts. Prof. Ehrmann was also prompted to write this revision by the continuing, impressive output of studies on modern French politics. Ehrmann critically reviews the most important discussions and indicates major areas that remain open for further investigation.

Paper 372 pages August 1976 $5.95

Cases in Comparative Politics

Third Edition
James B. Christoph
Indiana University
Bernard E. Brown
City University of New York

Extensively revised and updated, this new Third Edition of CASES IN COMPARATIVE POLITICS features eight case studies—two each on Britain, France, German, and the U.S.S.R.—that examine foreign and domestic policy-making in those countries. All of the cases were written by specialists expressly for this volume. New cases on university reform in France, codetermination in West Germany, and Ostpolitik have been added to this edition, and important new material has been incorporated into all the other cases. An introductory section deals with the case method in comparative politics and the concept of decision-making.

Paper 350 pages August 1976 $5.95

Political Socialization

Second Edition
Richard E. Dawson
Washington University
Kenneth Prewitt
University of Chicago
Karen Dawson
Washington University

Designed to introduce students to the process of political socialization, this book is organized around three basic issues: (1) What is learned through political socialization? (2) When and how does political socialization take place? (3) Through what social relationships and associations does political learning take place? In the new Second Edition, the authors have maintained the successful format of the original, while making significant changes in content and chapter order. A chapter comparing system and hegemonic theories of political system stability replaces the chapter on political culture. Chapters IV and V offer a more specific interpretation of the sequence and development of political outlooks (especially through childhood and adolescence). The latest thinking and research findings have been incorporated throughout.
Paper approx. 250 pages March 1977
$5.95 tent.

Behind the Scenes in American Government

People, Personalities, and Politics
Peter Woll
Brandeis University

The premise of this new reader is that the character and style of political leaders and the people around them have a profound impact on the political process. Prof. Woll has culled highly readable selections from popular media sources that show how different personalities interact with political institutions and processes to shape government. There are fascinating vignettes on party politicos, a pressure group leader, a Washington lawyer, a political reporter, Presidents and First Ladies, judges, a Cabinet Secretary and presidential advisor, and a top-level bureaucrat. BEHIND THE SCENES IN AMERICAN GOVERNMENT was designed to bring politics alive for students. It is appropriate for use with any basic text. An Instructor's Manual is available.
Paper approx. 400 pages March 1977
$6.95 tent.

Power and Interdependence

World Politics in Transition

Robert O. Keohane
Stanford University
Joseph S. Nye
Harvard University

Two widely-known and highly-respected political scientists have developed a new theoretical approach to the analysis of contemporary world politics. This approach is based on the assumption that traditional, "realist" models of world politics are inadequate for understanding contemporary reality. Keohane and Nye argue that *transnational politics* – based on, or arising from, various economic interdependencies – is a force that tends to counteract, even negate, the nation-state thesis. This original approach is applied to the analysis of two issue-areas – international monetary policy and the oceans – plus two country relationships – the U.S./Canada and the U.S./Australia.

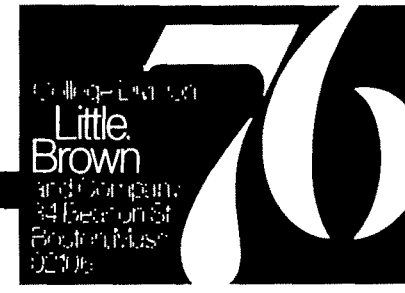
Paper approx. 300 pages
November 1976 $5.95 tent.

War, Peace, and International Politics

David W. Ziegler
Western Washington State College

Organized around the dramatic theme of war and its prevention, this new text provides an unusually coherent introduction to some of the basic concepts and propositions of international politics. The explicit intent of the author has not been to provide exhaustive coverage of the field, but rather to excite the interest of students. Ziegler takes a traditional, state-centered approach to his subject, providing a proper context for an understanding of the current literature that reacts against this orientation. Wherever possible he provides concrete illustrations of abstract concepts. An Instructor's Manual is available.

Paper approx. 464 pages
March 1977 $8.95 tent.



America in the Seventies

Problems, Policies, and Politics

Allan P. Sindler
University of California, Berkeley

AMERICA IN THE SEVENTIES features six *original* case studies – written by outstanding experts in their respective fields – on American politics and policy. It covers the major institutions of national government, as well as major current issues: busing, crime, affirmative action, impeachment, congressional reform, party reform. Its purpose is to involve and stimulate students and to promote class discussion.

Paper approx. 320 pages February 1977
$6.95 tent.

Felony Justice

An Organizational Analysis of Criminal Courts

James Eisenstein
Pennsylvania State University
Herbert Jacob
Northwestern University

In this important new book James Eisenstein and Herbert Jacob offer a comparative analysis of felony dispositions in three cities: Chicago, Detroit, and Baltimore. Their analysis is based on extensive observations and interviews in the field, as well as court and prosecutor file data on 4500 defendants. An explicit organizational approach facilitates understanding of the various patterns that emerge.

Paper approx. 280 pages
November 1976 $5.95 tent.

The Measure of Justice

An Empirical Study of Criminal Law Change

by RICHARD A. BERK, HAROLD BRACKMAN, and SELMA L. LESSER

A Volume in the QUANTITATIVE STUDIES IN SOCIAL RELATIONS Series

The long, heated debate over the ultimate sources of our criminal law reflects a variety of competing and complementary theoretical perspectives, including pluralism, conflict, consensus, and others. This timely study attempts to empirically evaluate some of the merits of these different approaches, using longitudinal data on the California Penal Code from the years 1955 to 1971. In addition to a traditional qualitative historical analysis of the period, it codes nearly 700 revisions in the law and analyzes them through Time Series techniques. Longitudinal trends for 12 different kinds of criminal law, including law affecting defendant rights, person crimes, property crimes, and crime without victims are plotted and described.

Using both the qualitative analyses and the findings of multivariate statistical procedures, the book proposes and tests various explanations for the over time patterns discovered. It finds that all of the perspectives have serious problems in accounting for the empirical data, but that the consensus model has the least to offer. The study concludes that the detailed content of our criminal law has far more to do with the exercise of political power than with fundamental notions of what is morally correct.

ISBN: 0-12-091550-2

The New Jersey Income-Maintenance Experiment, VOLUME 1

Operations, Surveys, and Administration

edited by DAVID KERSHAW and JERILYN FAIR
with a Foreword to the Series by Robert J. Lampman

A Volume in the INSTITUTE FOR RESEARCH ON POVERTY MONOGRAPH Series

The New Jersey Income-Maintenance Experiment is a three-volume series on the graduated work-incentive experiment dealing with a negative income tax and sponsored by the Office of Economic Opportunity from 1967 to 1972. The experiment is also noteworthy as an example of a critical cost-effectiveness study of a social program.

This first volume provides a nontechnical description of the experiment and its operations. It features: a summary of the history and results of the experiment; descriptions of the essential operating elements—selection of sample families, methods by which data were collected from the families, and the administration of the transfer payments; analysis of certain research and technical issues raised during the experiment; review of the more interesting and complex administrative problems faced as the experiment progressed.

1975, 246 pp., $15.00/£9.15
ISBN: 0-12-405050-6

Rebellion, Revolution and Armed Force

A Comparative Study of Fifteen Countries with Special Emphasis on Cuba and South Africa

by D. E. H. RUSSELL

A Volume in the STUDIES IN SOCIAL DISCONTINUITY Series

Recently banned in South Africa, this unique book is a systematic study of fourteen twentieth-century rebellions—seven successful and seven unsuccessful—with special emphasis on the behavior of the establishment armed forces in each instance. It begins by comparing the oppressiveness of the regimes of pre-rebellion Cuba and present-day South Africa. Finding the South African regime even more oppressive than the Cuban regime, the author argues that, according to most theories of the etiology of rebellion and revolution, a rebellion should have occurred in South Africa. This leads to a re-evaluation of prevailing theories of the nature of rebellion in the light of detailed analysis of the fourteen actual rebellions.

Written with precision and style, the volume contains such unusual features as: development of an original typology of rebellion, and redefinition of the terms "rebellion" and "revolution"; systematic examination of the concept of "regime oppressiveness"; emphasis on the importance of regime military variables rather than rebel military variables.

1974, 192 pp., $16.00/£9.75

111 FIFTH AVENUE, NEW YORK, N.Y. 10003
24-28 OVAL ROAD, LONDON NW1 7DX

"The CQ ***Guide to Congress*** is not only an invaluable historical reference for students of Congress, but an indispensable daily working tool in my congressional office and in the House Republican Conference which I chair. The new edition is a critical update, covering as it does the jarring events and landmark accomplishments of the last half-decade: the Watergate and intelligence inquiries and revelations, the impeachment proceedings, the warpowers and budget reforms, and the major power shifts and institutional changes in the Congress over the past few years."

—John B. Anderson (R Ill.)
Chairman, House Republican Conference

Guide to Congress

SECOND EDITION

1,100 pages, 8½ x 11"
LC No. 76-41925
November 1976.
Clothbound. $49.50.

Just Published - Second Edition

Announcing publication of a second edition of the book widely accepted as *the* reference on the U.S. Congress. This is no coffee-table edition—**Guide to Congress, Second Edition** belongs in every public library, college and high school in the country.

The first edition, published in 1971, was selected by the American Library Association as one of the "Outstanding Reference Books of 1971." The late Paul H. Douglas, former senator from Illinois, wrote, "It is a magnificent work, the best of its kind—reliable, accurate and fair."

But new legislation and changes in procedure prompted by Watergate, Vietnam and an increasingly Democratic Congress have outdated this standard reference work—hence this extensively revised second edition.

All the recent reforms are included plus scholarly but easily understandable explanations of how Congress works, its powers and the pressures upon it. Charts, a 225-page Appendix and a 45-page Index.

CONGRESSIONAL QUARTERLY INC.

The Finnish Dilemma

Neutrality in the Shadow of Power

George Maude. ☐ The author shows how consciousness of the basic dilemma inherent in Finland's security policy has led the country into an active foreign policy which seeks to promote multilateral relations and détente in the world without threatening the balance between the West and the Soviet Union. (Royal Institute of International Affairs)

1976 160 pp. $13.25

March 1939: The British Guarantee to Poland

A Study in the Continuity of British Foreign Policy

Simon Newman. ☐ Making full use of the new documents available, this work examines the origin and consequences of the British guarantee to Poland in March 1939. Although this study concentrates on an individual episode in the history of British foreign policy towards Hitler, the episode is used as a means of portraying a tenable, well-argued and well-documented interpretation of that policy in 1938 and 1939.

1976 264 pp. $14.25

On Capitalist Underdevelopment

André Gunder Frank. ☐ By presenting the history of underdevelopment in terms of political and economic changes which have affected it from its sixteenth-century beginning to the present, the author supports his thesis that underdevelopment is just as much a product and power of capitalism as is development.

1976 124 pp. paper $1.90

Second City Politics

Democratic Processes and Decision-Making in Birmingham

Kenneth Newton. ☐ How effective are the political institutions and processes which are supposed to guarantee the responsiveness and responsibility of political élites to citizens? To answer this question, Kenneth Newton draws on recent research in Birmingham, England, using it to test some of the main theories of democracy in urban society.

1976 284 pp.; 32 tables; figs. paper $11.00

The District

A Study in Decentralization in West Malaysia

J.H. Beaglehole. ☐ Based on research on the State of Kelantan in Malaysia, this study examines the consequences of political change and development policies for the colonial administrative legacy. The author discusses the actual working of district administration, and explores the particular problems of the interaction of administration and politics in an opposition state within a federal system. (Hull Monographs on South-East Asia)

1976 128 pp.; tables; map paper $6.75

THE AMERICAN POLITICAL SCIENCE ASSOCIATION AND THE

UNIVERSITY CENTER FOR INTERNATIONAL STUDIES

ANNOUNCE

A New Annual Reference Publication

UNITED STATES POLITICAL SCIENCE DOCUMENTS

United States Political Science Documents (USPSD) is the published version of a computer-based file of political science information being developed continually by the University Center for International Studies, University of Pittsburgh, in conjunction with the American Political Science Association.

Over the past ten years the political, social, and policy sciences have been inundated with an increasing flow of journal information. Not until now has a convenient sorting, filing, and evaluation process been developed to enable the academic community to keep up with the masses of information in a timely manner. This is why *USPSD* was created.

Volume I of *USPSD* will include between 2,000 and 2,500 documents published during 1975. The set will be available from UCIS Publications during the summer of 1976. For further information or to place your order, write to UCIS Publications at the address below.

USPSD will enable you conveniently to keep abreast of all the major journals in the field of political, social, and policy science, such as:

American Political Science Review
Comparative Political Studies
Comparative Politics
Economic Development and Cultural Change
Foreign Affairs
Foreign Policy
International and Intercultural Communication Annual
International Development Review
International Education and Cultural Change
International Interaction
International Organization
International Relations
International Studies Quarterly
Journal of Conflict Resolution
Journal of International Affairs
Policy Analysis
Policy Studies Journal
Studies in Comparative Communism
Studies in Comparative International Development
World Affairs
World Politics

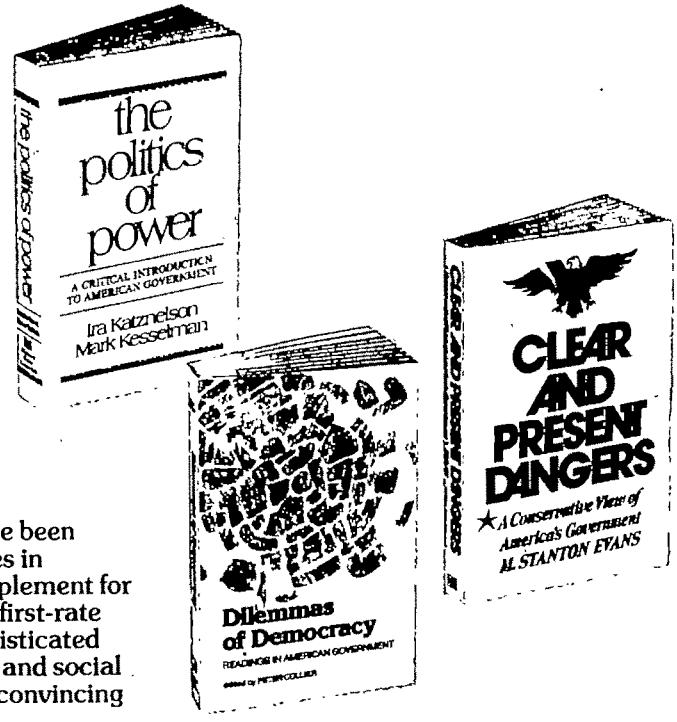
USPSD will be an annual reference publication which examines and analyzes every article in over 120 major political, social and policy science journals.

Each entry in *USPSD* provides:

1. Author;
2. Title;
3. Journal Source and pagination;
4. An Abstract that describes the scope, purpose, methods employed, and results obtained in each article;
5. A listing of Special Features that include titles of all tables, graphs, figures, and maps used in each article;
6. A listing of Authors Cited in footnotes or references;
7. A listing of Key Subject Descriptors attributed to each article;
8. A listing of the major Geographic Areas referred to in each article;
9. A listing of Proper Names of organizations, political institutions, laws, etc. mentioned in each article.

USPSD will be published annually in TWO PARTS. The abstracts of the journal articles will comprise PART II and include those items listed above. PART I consists of five indexes to all the articles abstracted in Part II; they are divided according to:

1. Author(s) of each article;
2. Descriptor Subjects that are attributed to each article (The descriptions are taken from over 3,000 terms listed in the Political Science Thesaurus);
3. Geographic Areas referred to in each article;
4. Proper Names of organizations, political institutions, laws, etc. mentioned in each article;
5. Journal in which each article is published.



USPSD can be purchased as a two volume set—PARTS I & II—or PART I, the indexes, can be purchased separately. Prices for both are as follows:

	Regular price	APSA-member price
PARTS I & II (Index & documents)	$90.00	$75.00
PART I (Index only)	$75.00	$60.00

The Political

The Politics of Power
A Critical Introduction to American Government
IRA KATZNELSON,
University of Chicago
MARK KESSELMAN,
Columbia University

"This is precisely the book I have been seeking for introductory courses in American politics and as a supplement for more advanced courses. It is a first-rate job, making valuable and sophisticated criticisms of American politics and social science and making them in a convincing and sophisticated manner."
—MARGARET LEVI, University of Washington

"An excellent book...presents an exciting and penetrating analysis of America's crisis in democratic rule. It has ignited terrific class discussions."
—WILLIAM J. STEVENSON, University of Wisconsin

Paperbound. 513 pages

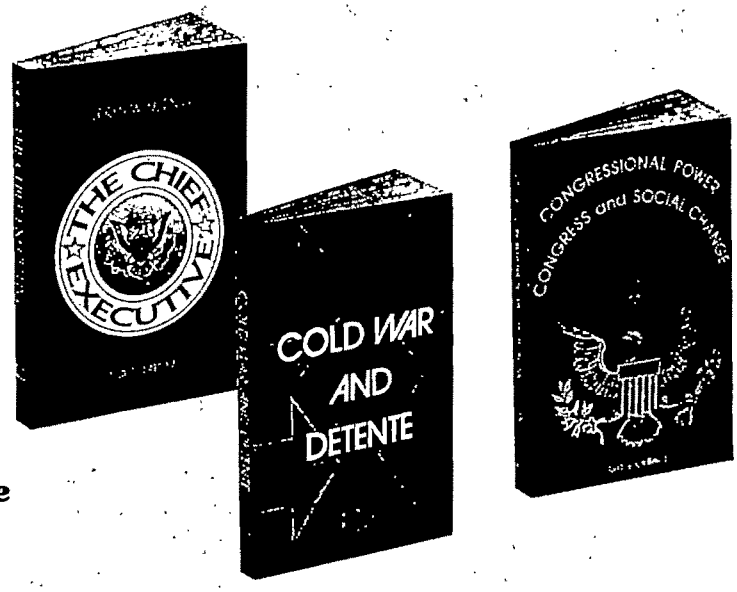
Dilemmas of Democracy
Readings in American Government
Edited by PETER COLLIER

"*Dilemmas of Democracy* is the perfect reader for our American Government courses. I am greatly impressed."
—PAUL B. DAVIS, University of Utah

"This is an excellent collection indeed. The emphasis of this reader is in the right place for our times. Rather than trying to encompass the vast complexity or the minutiae of our vast governmental enterprise, this reader goes selectively into key issues and problems for citizens as they face the whole baffling confusion of government from day to day."
—REED M. SMITH, Wright State University

Paperbound. 385 pages

Clear and Present Dangers
A Conservative View of America's Government
M. STANTON EVANS,
Chairman, American Conservative Union



"Stan Evans has written an extraordinary book, sound in principle and insightful in analysis, that promises to be among the foremost conservative writings of the decade."
—PHILIP M. CRANE, U.S. House of Representatives

"This excellent book makes it possible for the first time to provide students with a responsible conservative analysis of U.S. government and politics."
—ANTHONY BOUSCAREN, Le Moyne College

"Virtually guarantees lively class discussions and student participation."
—ROBERT E. BARTLETT, Jr., Southeast Missouri State College

Paperbound. 433 pages

Winners in '76

The Chief Executive
THIRD EDITION
LOUIS W. KOENIG,
New York University

Described in its previous edition as "the best full-length study of the Presidency we now have,"* this Third Edition of *The Chief Executive* has again earned a reputation as the preeminent textbook in its field. The voting record: instructors at more than 200 colleges and universities, coast-to-coast, have adopted it for their courses this year.

*quoted in *U.S. News & World Report*, December 2, 1968

Paperbound. 452 pages

Cold War and Détente
The American Foreign Policy Process Since 1945
PAUL Y. HAMMOND,
University of Pittsburgh

"This is an excellent work, concise, yet well researched. Rather than merely being another postwar history, Hammond's narrative is decidedly analytical, enabling the reader to discern those underlying political dynamics affecting foreign policy choices. Enriching the text are Hammond's penetrating critiques of presidential failures and successes in handling international demands...In short, *Cold War and Détente* is a fine source for anyone who wishes to grasp the essentials of the American foreign policy process in the postwar era."
—LARRY ELOWITZ, Georgia College
from a review in *Military Affairs*

Paperbound. 370 pages

Congressional Power
Congress and Social Change
GARY ORFIELD,
The Brookings Institution

"It's just excellent. It will really help to stimulate new interest in Congress. It puts Congress in a whole new dynamic context."
—JAMES DAVID BARBER, Duke University

"...excellent—readable, intelligent, and a welcome addition to the literature on the Congress."
—NORMAN J. ORNSTEIN, *Washington Post*, February 2, 1975

"The reader should find the treatment of popular stereotypes of Congress and the numerous criticisms of Congress refreshing."
—WESTON H. ANGOR, *Perspective*, June 1975

Paperbound. 339 pages

Harcourt Brace Jovanovich, Inc.
New York · Chicago · San Francisco · Atlanta

REMAKING FOREIGN POLICY
The Organizational Connection
Graham Allison and Peter Szanton

"The most searching look at organizational issues in foreign affairs we have had for a generation. Must reading for scholars, commentators and, above all, new administrators. Allison and Szanton break new ground."—RICHARD E. NEUSTADT. This thoughtful critique of the foreign policy establishment shows how time and again—in Viet Nam, during the Middle East crisis, in the nuclear disarmament talks—*organizational* weaknesses led to failures in policy and implementation. If the dismal record of the past decade is to be improved, profound restructuring of the lines of information and authority must occur; the authors' recommendations are concrete and certain to provoke controversy.
Just published $10.95

THE FIRST AMENDMENT AND THE FUTURE OF AMERICAN DEMOCRACY
Walter Berns

In this provocative new interpretation of the First Amendment, Professor Berns argues that democracy depends on the *character* of the people and that law should help foster "those decent habits required for self-government." Thus, concludes Berns, the Supreme Court has strayed from the intentions of the Founding Fathers in, for example, extending freedom of speech to pornography, or in withholding public aid from parochial schools. "Powerful. . . . Hits the mark. . . . A contribution beyond measure."—HON. JOSEPH T. SNEED, *United States Court of Appeals, Ninth Circuit.*
Just published $12.50

THE GOVERNMENTAL HABIT
Controlling the Economy from Colonial Times to the Present
Jonathan R. T. Hughes

In this first history of governmental control of the American economy, Professor Hughes (author of the widely acclaimed *The Vital Few*) demonstrates that, contrary to common belief, interference with our economic affairs enjoys a long and popular history in this country and that, despite its patchwork inefficiency, it is unlikely that Americans will replace it with rational public policy any time soon.
Due January $11.95

KISSINGER
The European Mind in American Policy
Bruce Mazlish

Cutting through the gossip and polemics, this sensitive profile probes Kissinger's background—his childhood, his family's expulsion from Nazi Germany, his "Americanization" in the U.S. Army, his unusual patrons and connections—and looks at his "Europeanization," in turn, of U.S. foreign policy. "A first-rate job. . . . Mazlish puts his finger on the key factors in Kissinger's career . . . and he discusses these factors in a dispassionate, intelligent, provocative fashion."—STANLEY KARNOW, *Washington Post Book World.*

Corporatism and Development
The Portuguese Experience

Howard J. Wiarda,
University of Massachusetts, Amherst

Professor Wiarda argues that corporatism—distinct from both liberalism and totalitarianism—is the Iberic-Latin American response to the major twentieth-century issues of capitalism, industrialization, and mass society. He examines the development of corporatist political ideology from Greek and Roman times to the present, using Portugal as a case study of corporatist practice. He documents the growth, transformation, and decline of Portugal's modern corporate state, concluding that though corporatism has failed to live up to its theoretical promises, it must not be dismissed as a model of analysis.

February 1977, 375 pp., cloth, $20.00

The Politics of Autonomy
A Kantian Reading of Rousseau's Social Contract

Andrew Levine,
University of Wisconsin, Madison

This volume is organized around three propositions: that resolution of the conflict between moral autonomy and legitimate state authority is the central problem in the *Social Contract*; that Rousseau understood this conflict better than the other contract theorists, notably Hobbes and Locke; and that Rousseau anticipated the attempt by Marx and other nineteenth-century thinkers to transcend traditional contractarian thought.

"The book is undogmatic, original and very easily understood. . . . In short, this is a first-rate book. . . "—Robert Paul Wolff.

December 1976, 208 pp., cloth, $12.00

Problem selecting a text for your course?

Duxbury Press has the answer

Politics, Change and the Urban Crisis

by Bryan T. Downes, *Chairperson, Division of Public Affairs, School of Community Service and Public Affairs at the University of Oregon*

Downes develops a dynamic alternative to the Banfield-Moynihan model of urban politics. The first of the 'new generation' urban texts to organize on an anti-pluralist base, it treats change as both a goal and a perspective. The emphasis is on *policy* — past, present and future — and citizen participation.

September 1976. 6½ x 9¼. 325 pages. Paperbound.

Public Bureaucracy: Perspectives and Values

by James A. Medeiros, *U.S. Public Health Service and* David E. Schmitt, *Northeastern University*

A brief, lucidly written "invitation to public administration" kind of text. Medeiros and Schmitt explore the major issues and controversies in modern public administration within a three-pronged integrated framework — It evaluates strategies for: 1.) improving upon the *technical* base of bureaucracy (machine bureaucracy); 2.) improving organizational performance by improving its *human* base (*humane* bureaucracy); 3.) improving organizational performance by improving its *political* base (*political* bureaucracy).

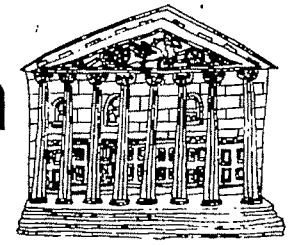
December 1976. 6½ x 9¼. 200 pages. Paperbound.

The Chicano Political Experience: Three Perspectives

by F. Chris Garcia, *University of New Mexico and* Rudolph O. de la Garza, *The Colorado College*

The first text to provide a balanced, concise overview and analysis of the Chicano in the United States political system, past and present. The book assumes no previous knowledge of the American political system or of the Mexican-American people. Three dominant and competing theories of power distribution in the U.S. are employed to form the framework for the text — *pluralist, elite* and *internal colonialism* perspectives are provided on each aspect of the Chicano political experience.

December 1976. 6½ x 9¼. 200 pages. Paperbound.



In the problems lie the answers

Begin with the problems, how they are defined and confronted, then follow them through the formidable machinery of public policy.

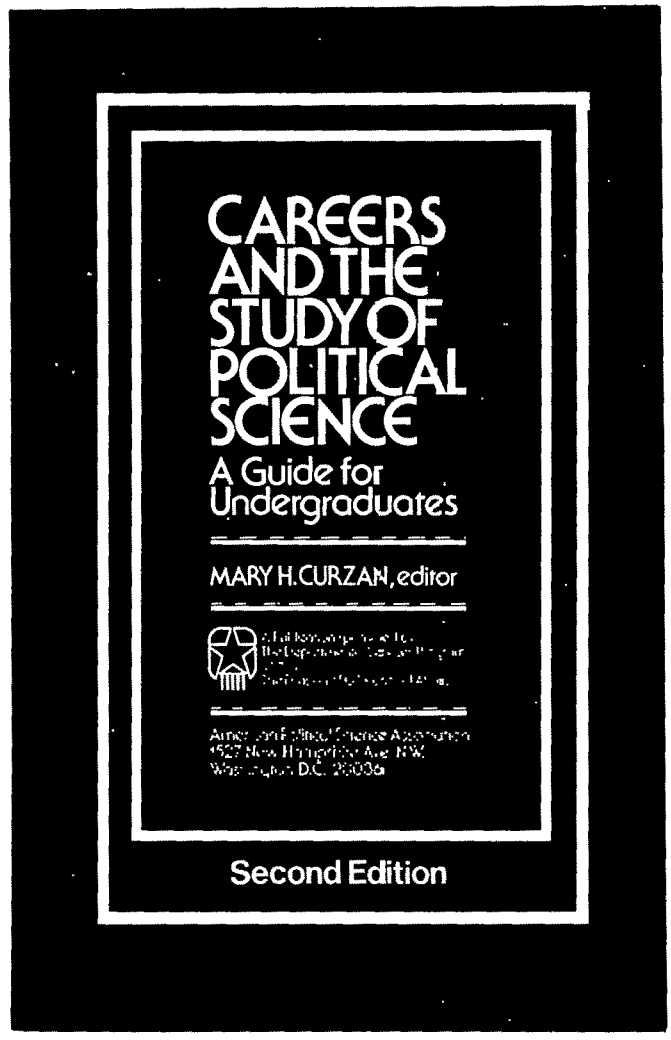
That's the strategy behind the success of AN INTRODUCTION TO THE STUDY OF PUBLIC POLICY. It has given the students a clear perception of the organic, shifting nature of the public policy process.

When the Jones text first appeared in 1970, the resurgence of interest in focusing on public policy as the key to understanding American politics was just emerging. The book was a pathbreaker.

Now Duxbury Press is proud to announce

An Introduction to the Study of Public Policy, 2nd edition

by Charles O. Jones, *Maurice Falk Professor of Politics, University of Pittsburgh, and Editor of the American Political Science Review*



- 4/5 of the text rewritten, infusing new conceptual material throughout
- New cases in energy, pollution, education, mental health, poverty
  An added chapter examining appropriations
- Research input from the author's recent book CLEAN AIR
  Equally provocative for introductory and advanced courses in American Politics and public policy

A framework-setting core text. February 1977. 5⅞ x 9. 272 pages. Paperbound.

Duxbury Press has the answers to your course needs. For more information on these and other Duxbury texts write:

Voting behavior... threat of nuclear mishap ... treatment of criminals and the mentally ill

America Votes:

What You Should Know About Elections Today

by Kevin Mulcahy and Richard Katz, both of Queens College, C.U. N.Y.

Here is an examination of the who, what, why, and how of American voting patterns today.

Drawing from Presidential, Congressional, state, and local election data, the authors explore the impact of issues, education, age, class, section of country, party identification, and a host of other variables to show why people vote the way they do.

Cloth $8.95 (02379-6)

The Nuclear Power Controversy

An American Assembly Book

Edited by Arthur Murphy, Columbia University

Nuclear power—is it the answer to an energy-hungry nations's prayer or a spectre of technological disaster?

In *The Nuclear Power Controversy,* seven authorities from the fields of atomic energy, economics, science, law, and technology offer information on key aspects of the current nuclear energy debate.

Ready Paper $3.95 (62557-4)
Cloth $9.95 (62558-2)

Decarceration:

Community Treatment and the Deviant—A Radical View

by Andrew Scull, University of Pennsylvania

Are early release programs, community rehabilitation centers, and half-way houses effective in treating criminals and the mentally ill? Or are such programs a danger to society and to the deviants themselves?

In *Decarceration,* Andrew Scull answers these and other questions, showing how the real reason behind these "reforms" is the state's urgent need to cut the cost of social control and its increasing ability to substitute welfare for institutionalization.

Ready Paper $3.95 (19764-0)
Cloth $8.95 (19765-7)

What's New from Winthrop Politics, and

Available December 3...

THE LOGIC OF INTERNATIONAL RELATIONS, 2nd Edition
Steven Rosen — The Australian National University and Brandeis University; **Walter Jones** — Northeastern University

This new edition of a widely adopted international relations text maintains its reputation for clarity, readability and lucid organization as well as its theoretical organization, which stresses perceptual theory (views of major actors in the contemporary international system and its components). *New in this Second Edition* is a chapter on America's major allies — Western Europe, Canada, Japan — with perspectives on them woven throughout the book. Also includes updated information on arms technology and national attitudes.

1977 448 pp. Paper $7.95

Available Now...

CONTEMPORARY POLITICS: EUROPE
Alexander J. Groth, Robert J. Lieber, Nancy I. Lieber — all of The University of California, Davis

New in 1976 and already acclaimed as the most innovative, up-to-date comparative government text available. A rare and excellent introduction to public policy questions and processes. Covers *standard* countries usually treated in most comparative government courses (Britain, France, Germany, Soviet Union) plus the *alternative* systems of government (Spain, Portugal, Greece, Yugoslavia).

1976 512 pp. Cloth $12.50

Available March 15...

DYNAMICS OF PUBLIC BUREAUCRACY: AN INTRODUCTION TO PUBLIC ADMINISTRATION
Fred A. Kramer — University of Massachusetts, Amherst

A new basic text, with strong focus on organization theory and attention to modern management techniques.

1977 320 pp. Cloth $10.95 (est.)

Available March 15...

PERSPECTIVES ON PUBLIC BUREAUCRACY, 2nd Edition
Fred A. Kramer — University of Massachusetts, Amherst

New revision of a unique set of readings with appeal to political science, public administration, business, and social welfare courses.

1977 200 pp. Paper $4.95 (est.)

Available March 15...

AMERICAN POLITICS IN A BUREAUCRATIC AGE: CITIZENS, CONSTITUENTS, CLIENTS, AND VICTIMS
Eugene Lewis — Hamilton College

Dynamic, provocative text, which argues that control of the public policy process has shifted to the public bureaucracy.

1977 250 pp. Paper $6.95 (est.)

in International Relations, Bureaucracy...

Available March 15...

AN INTRODUCTION TO POLITICAL ANALYSIS
David Apter — Yale University

This much-needed introductory political science text reviews the several schools of thought in the growth of the discipline — Political Philosophy, Institutionalism, Behavioralism, Pluralism, Structuralism, and Developmentalism — and discusses the future of Political Science.

1977 400 pp. (est.) Cloth $11.95 (est.)

Available February 1...

THE AMERICAN POLITICAL SYSTEM: A RADICAL APPROACH
Edward S. Greenberg — University of Colorado

This new interpretation of our political system goes further than other 'alternative' texts for American Government courses. It is also the first text in political science which uses a Marxist approach to the study of American political life within a modern textbook format. Instructor's Manual by Steven Quick (Holy Cross College) available.

1977 480 pp. Paper $7.95

Available Now...

LEADERSHIP AND CHANGE:
THE NEW POLITICS AND THE AMERICAN ELECTORATE
Warren E. Miller and **Teresa E. Levitin** — both of Center for Political Studies, The University of Michigan

This just-published, already widely acclaimed text is the most recent, up-to-date analysis of American voting behavior over the past quarter century. An excellent candidate for your courses on Electoral and Voting Behavior, Public Opinion and Participation, Political Behavior, Political Sociology, and Political Parties.

1976 256 pp. Paper $6.95 Cloth $12.50

Prices subject to change without notice.

For further information, or to order examination copies of any of these texts, please write to: Richard J. Marran, Dept. WJ-089, Winthrop Publishers, Inc., 17 Dunster Street, Cambridge, Massachusetts 02138.

Winthrop Publishers

Montesquieu and the Old Regime

Mark Hulliung

Was Montesquieu an "aristocratic liberal" or a "feudal reactionary?" In this reinterpretation Hulliung suggests that both characterizations are mistakes, in that they assume that Montesquieu was the supporter of aristocracy, of feudalism, of "intermediate bodies." Against these views the author argues that Montesquieu vigorously attacked the old social order, extolling England as the most free and progressive of nations. In sum, far from being an apologist for the old regime, Montesquieu was perhaps its most formidable critic. Hulliung draws upon all of Montesquieu's writings in highlighting the themes that were his lifelong concerns, and examines Montesquieu's relationship to other thinkers, especially Aristotle, Machiavelli, Bodin, Richelieu, and Bossuet.

272 pages, $11.50

Bail Reform in America

Wayne H. Thomas, Jr.

This is a study of major national efforts in the past 15 years to reduce the impact of money, and the lack of it, in determining whether a criminal defendant obtains freedom prior to trial. Thomas offers the results of a national study on bail reform since its beginning with the Manhatten Bail Project of 1961 and a survey of the major operational changes in the bail system since then. The successful use of release on own recognizance in the Manhatten Bail Project sparked bail reform legislation and lead to the development of other pretrial release mechanisms. Thomas concludes that the challenge of bail reform is to integrate existing pretrial release options in a comprehensive plan to provide the quickest, least restrictive form of release for defendants consistent with maintaining the integrity of the criminal justice system.

288 pages, $10.00

Reform and Revolution in China

The 1911 Revolution in Hunan and Hubei

Joseph W. Esherick

The 1911 revolution marked the end of the Chinese empire, but the ensuing years of warlordism demonstrated the weakness of republican institutions. Esherick seeks the political and social origins of the Revolution in two provinces, Hunan and Hubei, which throughout the period 1895-1913 were important centers of reform. Previous studies have stressed the vitality of the late imperial reform movement, and have suggested that, but for a failure in imperial leadership, the reforms could have become a viable alternative to revolution. Esherick sees the reforms as having facilated the creation of a new urban elite, which was as much interested in inhancing its own power as in reviving China.

335 pages, $15.00

Curing the Mischiefs of Faction

Party Reform in America

Austin Ranney

"Ranney . . . is considered one of the most penetrating commentators on American party politics. His work combines a deep understanding of the workings of a two-party system in a complexly divided nation and a continuing preoccupation with the effects on democracy of different possible ways of organizing political parties . . . Presented with clarity, perspective, and fluency in a way that makes the book . . . must reading for students of American parties." —*Choice*

Social Limits to Growth
A Twentieth Century Fund Study

Fred Hirsch

$10.00

Fred Hirsch argues brilliantly that the limits on extension of welfare through growth are social as well as economic. In the future the debates should not be couched in terms of "how much growth" or of "no growth," but of why the affluent compete among themselves and how they create social scarcity. Kenneth Boulding comments, "(This) is an important book and a major contribution to social thinking and economics."

The Dynamics of Soviet Politics

Paul Cocks, Robert V. Daniels, and Nancy Whittier Heer, *Editors*

Russian Research Center Studies, 76

$17.50

Expert authors offer here an inside view of the workings of a closed political system. Their work, building upon the achievements of Soviet studies over the last thirty years, covers new ground that will enable future studies of Soviet politics and social practices to move ahead unencumbered by stereotypes and mystification.

The African Diaspora

Interpretive Essays

Martin L. Kilson and Robert I. Rotberg, *Editors*

$18.50

Since 1500, ten million Africans have left their homelands for destinations in the old and new worlds. *The African Diaspora* is the first book to chronicle and interpret this long, painful, but sometimes rewarding exodus. The editors, leading authorities on African, Caribbean, and black American history and politics, have assembled sixteen essays that delve into the ways in which Africans became exiles and how they responded to their new environment. This long-needed book corrects many myths of exodus and adaptation.

The United States and the Southern Cone

Argentina, Uruguay, and Chile

Arthur P. Whitaker

American Foreign Policy Library

$20.00

"As fine as anything Whitaker has ever written. . . . I think that it will rank for many years to come as among the most successful general syntheses that the Latin American field has produced since World War II."—Fredrick B. Pike

Whitaker writes about the closely linked cone countries from the time of their liberation to the present. He also treats each nation as a separate entity and traces its relations with the United States.

HARVARD UNIVERSITY PRESS

CAMBRIDGE, MA 02138

Supplementary Empirical Teaching Units in Political Science:

New computer related instructional materials whereby students learn important substantive topics in American politics as they learn methods of analysis.

Seven SETUPS: American Politics Are Available Now for Class Use

1. *Voting Behavior: The 1972 Election* by Bruce D. Bowen, C. Anthony Broh, Charles L. Prysby.
2. *Political Socialization Across the Generations* by Paul Allen Beck, Jere W. Bruner, L. Douglas Dobson.
3. *Political Participation* by F. Christopher Arterton, Harlan Hahn.
4. *The Supreme Court in American Politics: Policy Through Law* by John Paul Ryan, C. Neal Tate.
5. *U.S. Energy, Environment and Economic Problems: A Public Policy Simulation* by Barry Hughes.
6. *Representation in the United States Congress: 1973* by Ray A. Geigle and Peter J. Hartjens.
7. *The Dynamics of Political Budgeting: A Public Policy Simulation* by Marvin K. Hoffman.

Four SETUPS: Cross-National and World Politics Will Be Available for Class Use, Winter 1977

1. *Comparative Voting Behavior* by Herbert B. Asher, Bradley Richardson.
2. *The Budgetary Process in Cross-National Perspective* by John Creighton Campbell, John M. Echols.
3. *Conflict in the Middle East: A Public Policy Simulation* by Karen Ann Feste.
4. *Are Political Values Really Changing?* by Charles Taylor.

Each SETUPS is a module that can be taught in one to two weeks. SETUPS were designed to supplement instruction in introductory courses. But SETUPS have been field tested successfully in upper division courses. SETUPS were developed by faculty in workshops supported by a grant from the National Science Foundation to the American Political Science Association and hosted by the Inter-University Consortium for Political and Social Research, summer, 1974 and summer 1975.

Each SETUPS Module Includes a Monograph and a Data Set

The monograph is a 5½" x 8½" paperback of approximately 100 pages with:

1. A substantive essay on the topic.
2. Analytical exercises.
3. Instructions about how to do the exercises.
4. Suggestions for further readings and exercises.
5. A code book for the data set.

The data sets are prepared and distributed by the Inter-University Consortium for Political and Social Research. SETUPS data can be ordered for use with SPSS, OSIRIS or as card image.

Each SETUPS will cost $3.50. Lower prices are arranged for bulk orders. An order for 25 or more SETUPS will entitle you to the data sets for *all the SETUPS* at no extra charge.

To Order SETUPS

Order the SETUPS monographs from the American Political Science Association through your bookstore. Ask your bookstore to include your name when they place the SETUPS order with APSA. When we confirm the bookstore order, we shall send you a data-specification form if your school does not have the SETUPS data set already.

Announcing

Giovanni Sartori's

PARTIES AND PARTY SYSTEMS

A Framework for Analysis

"The appearance of the first volume of Giovanni Sartori's *Parties and Party Systems* is the most important event in political parties' scholarship since Ostrogorski opened the subject to systematic inquiry at the turn of the century. It draws on a remarkable historical depth and systematizes and interprets contemporary knowledge of parties and party systems in Europe, the Americas, Africa and Asia. It is theoretically subtle and profound, methodologically sophisticated and rigorous. It will be the leading work in the field for a long time to come."—GABRIEL ALMOND, *Stanford University*

"Readers of Professor Sartori's long awaited book on political parties will not be disappointed. It will be for the next generation of scholarly work on parties what Duverger's was for the last. One may agree or disagree with what Sartori has to say but for many years to come his will serve as the authoritative statement that every serious discussion of political parties will have to take into account."—ROBERT A. DAHL, *Yale University*

"The first major general book on its topic in two decades. Required reading for all who seek to understand political parties."
—FRED GREENSTEIN, *Princeton University*

This first volume of Giovanni Sartori's two-volume work is fully self-contained. The second volume is in preparation.

Existential Marxism in Postwar France

From Sartre to Althusser

MARK POSTER

"Poster has construed his subject in so wide a fashion as to have written a virtual intellectual history of modern France. His book articulates the resources and dilemmas of two of the most significant modes of thought in the modern world. . . . No other English-language study covers so much ground."—*Fredric Jameson, University of California* $17.50

On War • CARL VON CLAUSEWITZ

Edited and Translated by MICHAEL HOWARD and PETER PARET
With Commentaries by PETER PARET, MICHAEL HOWARD, and BERNARD BRODIE

On War constitutes the most significant attempt in Western history to understand war, both in its internal dynamics and as an instrument of policy. Since the work first appeared in 1832 it has influenced generations of soldiers, statesmen, and intellectuals. The present edition for the first time returns to the original German to make a classic of Western thought available to the English-speaking world in a reliable and readable text. *Written under the auspices of the Center of International Studies, Princeton University* • $18.50

The Irish Triangle

Conflict in Northern Ireland

ROGER H. HULL

"This is the first major analytic study of the Irish conflict that develops guidelines for appraisal and settlement. It promises to be an exceedingly useful volume."—*Richard A. Falk, Princeton University.* In his examination of the struggle, Hull sympathetically presents the views from Dublin, London, and Belfast, his analysis of them, and his own conclusions. $15.00

Czechoslovakia's Interrupted Revolution

H. GORDON SKILLING

For about eight months in 1968 Czechoslovakia underwent rapid and radical changes that were unparalleled in the history of communist reform; in the eight months that followed, those changes were dramatically reversed. Skilling provides a comprehensive analysis of the events of 1968, assessing their significance both for Czechoslovakia and for communism generally. *Written under the auspices of the Centre for Russian and East European Studies, University of Toronto*

Cloth, $45.00 • Limited Paperback Edition, $15.00

Imperial Germany and a World Without War

The Peace Movement and German Society, 1892-1914

ROGER CHICKERING

This book provides the first thorough examination of the peace movement in pre-World War I Germany, concentrating on the factors in German politics and society that account for the movement's weakness. The author draws on a wide range of documents to survey the history, organization, and ideologies of the peace groups, placing them in their social and political context.

Parliaments of the World

A Reference Compendium
Prepared by Valentine Herman with the collaboration of Françoise Mendel
Edited by Inter-Parliamentary Union
1976. Large-octavo. XII, 985 pages. Bound DM 168,–; $70.00
ISBN 3 11 006975 X

Parliaments of the World is an exhaustive survey of all aspects of the composition, organisation and operation of 56 Parliaments as well as their legislative, budgetary and control functions. It takes the form of a series of 70 tables with country-by-country entries, each table being preceded by explanatory text.

The book contains material gathered during an international enquiry conducted by the International Centre for Parliamentary Documentation, a department of the Inter-Parliamentary Union.

Parliaments of the World is deliberately conceived as a compilation of data displayed for each country in turn, avoiding judgements and evaluations. The result is a reference compendium of lasting interest to scholars as well as to parliamentarians, politicians, journalists and all people involved in the work and life of parliamentary institutions.

New Editions of Distinguished Texts

Democracy for the Few

Second Edition

Michael Parenti

- A best-selling analysis and critique of American government and politics, *Democracy for the Few* has been hailed as:

  "By far the best American government text I've seen."
  —William A. Barnes, Ohio State University—Lima

  "...a first class study—a creative piece of work beyond what one normally refers to as a textbook."
  —H. H. Wilson, Princeton University

  "An outstanding book which launches an intelligent, well-reasoned, frontal assault on the sacred cows of American politics."
  —H. Michael Erisman, Mercyhurst College

- The Second Edition, while retaining the basic structure and size of the First, includes updated materials and examples, and expanded chapters on the media, law and order, and political economy.

  February 1977 approx. 320 pages, illustrated
  paperbound, $4.95 (tentative)

State Politics in the United States

Second Edition

Kenneth T. Palmer, *University of Maine—Orono*

- Widely used in courses on state and local government and American government, *State Politics in the United States* has been cited as:

  "The best short text on state politics I have seen."
  —Paul C. Schmidt, California State University

  "Concise and penetrating analysis of the fundamental patterns of state politics." *—Bill Jackson, Mobile College*

- This thoroughly revised and updated edition features helpful chapter summaries and includes new material on intergovernmental relations, public policymaking, public opinion, state bureaucracies, and state environmental differences.

  February 1977 approx. 240 pages, illustrated
  paperbound, $4.95 (tentative)

from St. Martin's Press

American Government
A Brief Introduction

Second Edition

Max Skidmore, *Southwest Missouri State University*
and
Helen Marshall Carter, *University of Texas at El Paso*

- Brief, comprehensive, and flexible, here is the second edition of a highly successful, provocative core text for courses in American government.

  "Exactly what I've been looking for—a short, pithy book that lays out the broad outlines of American government and how it actually performs . . . an ideal core book."
  —William Jenkins, Wayne State University

- Thoroughly updated, the Second Edition includes material on Watergate, congressional reform, the Ford presidency, and the 1976 elections.
- A revised and expanded Instructor's Manual is available.

February 1977 approx. 256 pages, illustrated
paperbound, $4.95 (tentative)

Technology and Man's Future

Second Edition

edited by
Albert H. Teich, *George Washington University*

- A new, extensively revised edition of a highly acclaimed text—

  "An important, provocative work, particularly useful in the study of change." *—Avtar Singh, East Carolina University*

  "In a class by itself as a selection of readings on the subject."
  —Lester G. Hawkins, SUNY at Albany

- Organized to provide maximum flexibility, the articles include some of the most significant contemporary thought on the relationship between technology and society—the only book now available that gives thorough coverage of the "limits of growth" debate and issues of assessment and control.

February 1977 approx. 300 pages paperbound, $4.95 (tentative)

From the "Red Scare" to Women's Rights, the fight for civil liberties goes on...

THE PULSE OF FREEDOM: American Liberties, 1920-1970s spans five decades of this country's struggle to maintain and enlarge basic human rights. Six scholar-historians chart the course of this often bitter struggle: the amnesty drive for World War I conscientious objectors; the Scopes "monkey trial"; the curbs on liberty during World War II; the McCarthy years; the beginnings of school desegregation in the 50s; and the large-scale civil rights advances and student protests.

THE PULSE OF FREEDOM tells the stories behind the fight by the American Civil Liberties Union and others against suppression of or injustice for men and ideas of the widest possible spectrum: for black sharecroppers and members of the Ku Klux Klan; for an accused murderer and an antiwar demonstrator; for a dismissed teacher and a member of the American Nazi Party. "There is no better survey of this kind in print!" —*The Nation*. "Fine and authoritative." —*Library Journal*

1977, 512 pages, $12.95*

AMERICAN SYSTEM OF GOVERNMENT,
Thirteenth Edition
1977, 640 pages, $14.95*

John H. Ferguson and Dean E. McHenry

The most thorough revision in the thirty-year history of these highly successful texts. More than 50% rewritten, both books have been reduced in length, and the writing has been made simpler, clearer, and more readable for today's student.

Features you'll find in both texts

- Results of the 1976 presidential election are analyzed
- Traditional political concepts and practices are re-examined in light of current issues
- Thoughtful coverage is given to revenue sharing, election financing, Congressional reform and counter-reform, the energy crisis and the Federal response to it, and other contemporary issues

Features you'll find in AMERICAN SYSTEM OF GOVERNMENT

- Increased emphasis on citizen participation at the local level
- New discussion of finances and services including state and local debt
- Five chapters that explore in depth state and local government and the problems and challenges they face

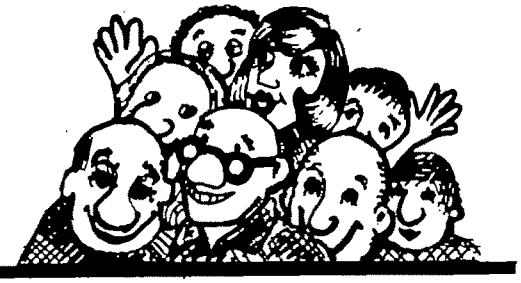
UNDERSTANDING AMERICAN POLITICS THROUGH FICTION,
Second Edition
Myles L. Clowers,
San Diego City College,
and Lorin Letendre,
CTB/McGraw-Hill and Cabrillo College

Organized to accommodate either the topical (institutions) or the systems approach, this paperback features writers from the entire political spectrum. *New to this edition:* A new chapter on the Constitution; a new chapter on policy; and new selections on political polling, political campaigning, interest groups, nativism and ethnic politics, bureaucratic discretion of the CIA, and plea bargaining. 1977, 356 pages, paper, $4.95*

POLICE ADMINISTRATION,
Fourth Edition
The late Orlando W. Wilson
and Roy Clinton McLaren,
Chief of Police, Arlington, Virginia
and former Director, Field Operations Division, International Association of Chiefs of Police

This text covers all aspects of police administration, establishing a coherent system which is internally consistent. *New to this edition:* A new chapter on team policing; a new chapter on management theory and organizational behavior; and new material on the impact of women and minorities in law enforcement, the implications of several important pieces of recent legislation, management by objectives, zero-base budgeting, enhancement of productivity, crime resistance, SWAT, hostage negotiation, and technological advances. 1977, 768 pages, $13.95

*Instructor's manuals are available for these texts.



Prices subject to change.

THE AMERICAN CONSTITUTION,
Third Edition
C. Herman Pritchett,
University of California, Santa Barbara

Now in its third edition -- the classic analytical examination of the Constitution. More than 1,000 Supreme Court cases are analyzed or cited. *New to this edition:* Coverage of every important constitutional issue that has arisen, since the last edition -- including capital punishment, affirmative action, exclusionary zoning, abortion, and executive privilege, 1977, 704 pages, $16.50

GOVERNING URBAN AMERICA,
Fifth Edition
Charles R. Adrian,
University of California, Riverside,
and Charles Press,
Michigan State University

Written with sympathy for the problems of local government officials, this text presents a realistic appraisal of strengths and weaknesses of both government and citizens. *New to this edition:* New approaches to urban financing, especially revenue sharing; analysis of the trend toward structural change; reorganized and rewritten chapters on urban public and metropolitan areas; coverage of recent developments such as "neighborhood" government and minority and women candidates. 1977, 512 pages, $12.95

Edward Artinian
Vice President / Director
College Department

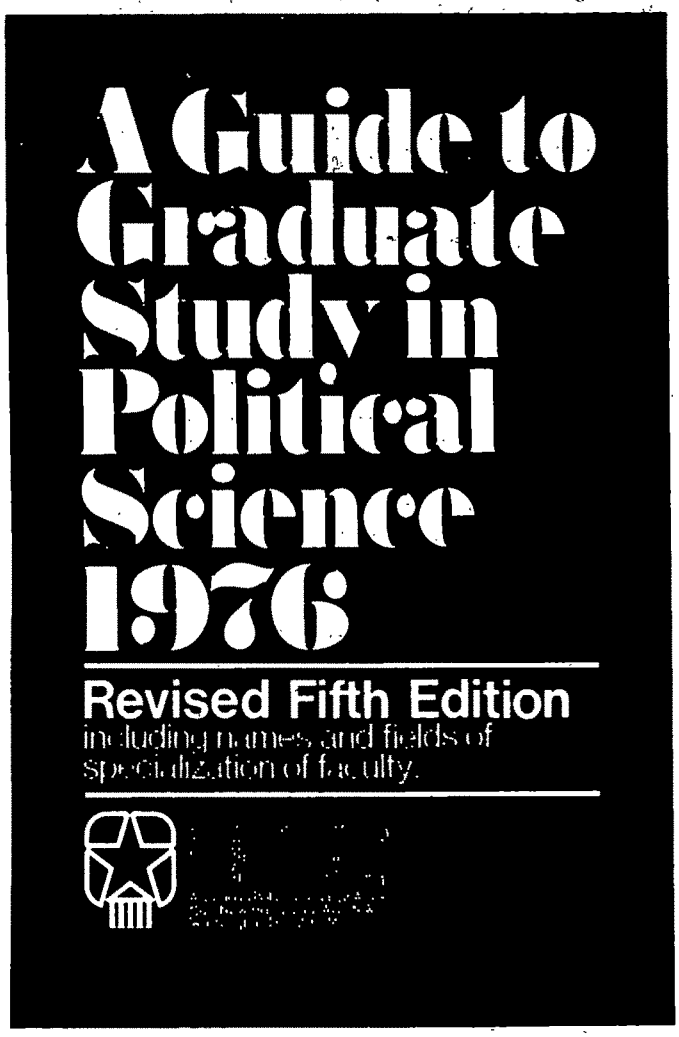
1 December 1976

Dear Political Scientist:

David McKay is proud to announce the publication in April of THE ELECTION OF 1976 by Gerald M. Pomper, chairman of the political science department at Rutgers University. This book offers an early interpretation of the crucial election of 1976 by five specialists in American politics.

In seven chapters the authors will analyze the Presidential nominations, the Presidential election, the issues of the campaign, the Congressional election and legislative prospects, the likely course of the new administration, important state and local elections, and the significance of the 1976 contest in the long-term development of American history.

The contributors of the essays include Ross K. Baker, Wilson Carey McWilliams, Jr., Henry A. Plotkin, Charles E. Jacob, and Gerald M. Pomper.



This volume will supplement every American politics text and bring it up-to-date. It will be 176 pages and priced at only $3.95 in paperback, be sure to order your desk copy now.

Sincerely,

Edward Artinian

Freedom and the Court
Third Edition

HENRY J. ABRAHAM, University of Virginia. This well-known work articulates the role of the United States Supreme Court in its continuing endeavor to identify and justify the lines and limits that our democratic system imposes in an effort to reconcile the rights of individuals and society. In this Third Edition, the author focuses on major issues of public law, such as freedom of expression, racial and political equality, criminal justice, and religion.

February 1977 480 pp. cloth $17.95 paper $4.50

Karl Marx Reader

Edited by DAVID McLELLAN, University of Kent. This volume provides a full account of the thought of Karl Marx. The arrangement of the readings is chronological, thus emphasizing the development of Marxian thought. Much of the material in this book has never been published in English or found in popular volumes of Marx readings.

Spring 1977 752 pp. cloth $12.00 paper $5.95

Party Dynamics
The Democratic Coalition and the Politics of Change

RICHARD L. RUBIN, Columbia University. A penetrating analysis of the weakening of past relationships within the Democratic party, this book also provides insights into the dynamics of the American party system.
". . . Professor Rubin has rendered great service in this taut, fact-laden book. He does not waste or mince words." —George Daly in **New York Law Journal**

1976 220 pp. cloth $9.95 paper $4.00

Secrecy and Foreign Policy

Edited by THOMAS M. FRANCK, New York University; and EDWARD WEISBAND, State University of New York, Binghamton. In this collection of twenty-four readings, leading legislators, policy makers, lawyers, and journalists probe the delicate balance between the people's right to know and the government's need for confidentiality, as seen in such cases as Watergate, the Pentagon Papers, and the question of "executive privilege."

1974 (paper, 1976) 480 pp. cloth $15.95 paper $4.00

The Brazilian Communist Party
Conflict and Integration 1922 - 1972

RONALD H. CHILCOTE, University of California, Riverside. The author examines the history, structure, and potential of the Communist Party of Latin America's largest nation in "an invaluable book for those interested in understanding the Latin American Left." —Joseph A. Ellis, City College of New York. "I think this will stand as the definitive work on the Brazilian Communist Party in English." —James Nelson Goodsell, **Christian Science Monitor**

1974 380 pp. $17.50

Prices and publication dates are subject to change.

Listing and Order Form for Publications of the AMERICAN POLITICAL SCIENCE ASSOCIATION

THE AMERICAN POLITICAL SCIENCE REVIEW

Quarterly journal of scholarly articles and book reviews in political science. Included in APSA membership. Back issues: $10.50 per copy; $42.00 per volume.

PS

Quarterly journal of Association news and articles of professional concern. Included in APSA membership. Back issues: $2.00 per copy; $8.00 per volume.

DEA NEWS FOR TEACHERS OF POLITICAL SCIENCE

Newspaper on education and the curriculum. Included in APSA membership.

ANNUAL MEETING PROGRAM

Final program for APSA Annual Meeting. Included in Annual Meeting Registration. Extra copies: $.50.

APSA ANNUAL MEETING PAPERS**

Hard copies, $3.00 each.

APSA ANNUAL MEETING PROCEEDINGS**

Microfilm reels of all papers, 1901-1912; 1956-present. $22.00 per reel. (approx. 7 reels per meeting.)

CUMULATIVE INDEX TO THE AMERICAN POLITICAL SCIENCE REVIEW**

1906-1968, $6.50.

CUMULATIVE INDEX TO THE PROCEEDINGS OF THE ANNUAL MEETINGS**

Key word index to all papers included in proceedings of Annual Meetings for 1904-1912; 1956-1970: $18.50.

WOMEN IN POLITICAL SCIENCE: STUDIES AND REPORTS, 1969-71 OF THE APSA COMMITTEE ON THE STATUS OF WOMEN IN THE PROFESSION**

PB 486, $6.00 microfilm; $16.50 Xerographic reprint (U.S. prices).

POLITICAL SCIENCE THESAURUS

A major reference tool in political science; this volume represents the terminology control device for a computer-based information retrieval service. Individuals: Hardback: $20.00; Paper: $15.00. Institutions: Hardback: $30.00; Paper: $25.00.

APSA BIOGRAPHICAL DIRECTORY (Sixth Edition, 1973)

Biographical information on over 7,000 Association members, plus names and addresses for approximately 12,500 members. Members: Hardback: $7.50; Paper: $5.00. Non-Members: Hardback: $12.50; Paper: $10.00.

APSA DIRECTORY OF MEMBERS: ANNUAL SUPPLEMENT TO THE APSA BIOGRAPHICAL DIRECTORY

Names and current addresses of all APSA members. $3.00 each.

GUIDE TO PUBLICATION IN POLITICAL SCIENCE

Co-sponsored by the APSA Committee on the Status of Women and the Women's Caucus for Political Science. $1.00.

ROSTER OF WOMEN IN POLITICAL SCIENCE (4th edition)

Biographical information on women political scientists. $3.00 each for members; $5.00 for non-members.

ANNUAL APSA DIRECTORY OF DEPARTMENT CHAIRPERSONS

Names and addresses of Chairpersons of departments offering political science at four-year institutions. $20.00 each.

PERSONNEL SERVICE GUIDELINES FOR EMPLOYERS AND APPLICANTS

Pamphlet containing information and guidelines for members of the APSA Personnel Service and for employers listing their vacancies in the Personnel Service Newsletter. No charge.

PERSONNEL SERVICE NEWSLETTER

Monthly listing of positions for political scientists. APSA Members: $8.00 subscription.

CAREERS AND THE STUDY OF POLITICAL SCIENCE: A GUIDE FOR UNDERGRADUATES

A monograph discussing the relationship between political science knowledge and skills and careers in law, government, business, journalism, teaching, etc. $.50 each; bulk rates available.

**Order from: Customer Service Department, University Microfilms, 313 North First Street, Ann Arbor, Michigan 48106.

CAREER ALTERNATIVES FOR POLITICAL SCIENTISTS: A GUIDE FOR FACULTY AND GRADUATE STUDENTS by Thomas E. Mann

A monograph containing practical advice for obtaining nonacademic employment. $1.00 each.

GUIDE TO GRADUATE STUDY IN POLITICAL SCIENCE

Compilation of Ph.D. and Masters programs in political science. The 1976 Guide is revised and expanded to include listings of faculty and fields of specialization. $4.00 each.

SOURCES OF FINANCIAL SUPPORT FOR POLITICAL SCIENTISTS: RESEARCH EDUCATION, PROFESSIONAL DEVELOPMENT BULLETIN 1: SUPPORT FOR PROFESSIONAL DEVELOPMENT: FELLOWSHIPS AND TRAINEESHIPS

Information on post-doctoral fellowships, internship programs, special training support and foreign travel grants available to faculty and advanced graduate students. $1.00 each.

GLOBAL DIMENSIONS IN U.S. EDUCATION

A joint publication of the APSA Committee on Pre-Collegiate Education, the Education Commission of the International Studies Association, and the Center for War/Peace Studies of the N.Y. Friends Group, Inc. Four publications: The Elementary School, The Secondary School, The University, The Community. $1.50 each, $5.00 per set.

COMPARING POLITICAL EXPERIENCES

Complete description of an alternative course for high school government instruction. $2.75 each.

SETUPS: AMERICAN POLITICS

Supplementary Empirical Teaching Units in Political Science

New computer related instructional materials whereby students learn important substantive topics in American politics as they learn methods of analysis. *Voting Behavior: The 1972 Election* by Bruce D. Bowen, C. Anthony Broh, Charles L. Prysby. *Political Socialization Across the Generations* by Paul Allen Beck, Jere W. Bruner, L. Douglas Dobson. *Political Participation* by F. Christopher Arterton, Harlan Hahn. *Representation in the United States Congress: 1973* by Ray A. Geigle, Peter G. Hartjens. *The Supreme Court in American Politics: Policy Through Law* by John Paul Ryan, C. Neal Tate. *U.S. Energy, Environment and Economic Problems: A Public Policy Simulation* by Barry Hughes. *The Dynamics of Political Budgeting: A Public Policy Simulation* by Marvin K. Hoffman. For information and price list write: APSA Division of Educational Affairs. $3.50 each; lower price on bulk orders.

INSTRUCTIONAL RESOURCE MONOGRAPHS

Guides on materials and methods for teaching and learning in political science. *A Guide to Library Sources in Political Science: American Government* by Clement E. Vose. $6.50 hardback; $4.00 paperback. *PSI and Political Science: Using the Personalized System of Instruction to Teach American Politics*, edited by Ralph B. Earle Jr. $3.50 paperback. *Simple Simulations*, by Charles Walcott with Anne Walcott. $3.50 paperback. *Computer-Assisted Instruction in Political Science*, edited by Jonathan Pool. $4.00 paperback. *U.S. Census Data for Political and Social Research: A Resource Guide*, $4.00, and *U.S. Census Data for Political and Social Research: A Student Manual*, $2.50, both by Phyllis G. Carter. *The Case of the Unreturned Cafeteria Trays* by Lloyd S. Etheredge, $1.00 each.

LEGISLATIVE SERVICE PROJECT MANUALS

Individual manuals available for: Kansas, Kentucky, Montana, Ohio, Oregon, Rhode Island. $2.50 each.

POLITICAL SCIENCE AND STATE AND LOCAL GOVERNMENT

A volume on the current and future state of research and educational programs in the field of state and local government. $3.75 each.

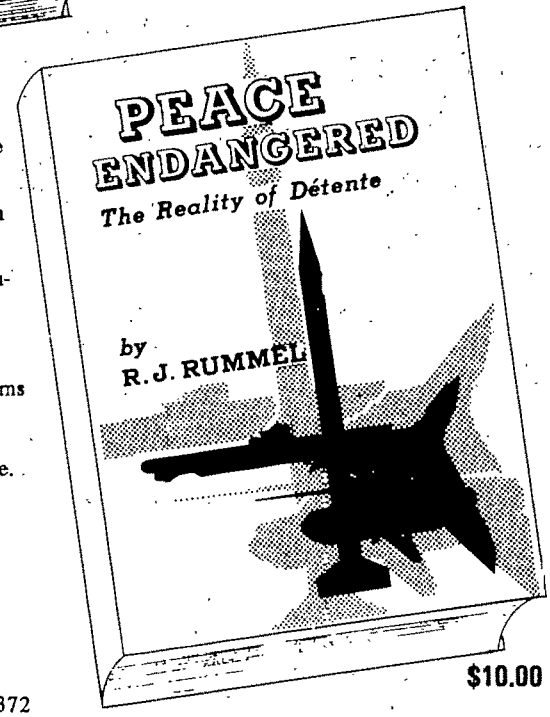
TWO VITAL TOPICS FOR TODAY FROM SAGE PUBLICATIONS



$10.00

- How much can the crime rate be reduced by changing the police, the courts, the prisons, or the law?

Criminologists, sociologists, politicians, and citizens have argued this question for years. But what if the question is itself meaningless? What if neither repression *nor* reform is an effective response to crime—because *neither* makes a difference in the crime rate!

This sobering conclusion is suggested by ROGUES, REBELS, AND REFORMERS, a landmark analysis of urban crime and conflict. Drawing on a major comparative study of the last 150 years of crime and punishment, this book is dramatic evidence that not only is there no easy solution to the dilemma of crime in our times, but that for modern democratic societies crime may well be one of the inevitable prices we pay for freedom. This important new study, written by Ted Robert Gurr—professor of political science at Northwestern University, author of *Why Men Rebel* and coauthor of *Violence in America*—draws on data from London, Stockholm, Sydney, and Calcutta—with important implications for the rest of the world.

192 pp. L.C. 76-17370

$10.00

- The Soviets will have preclusive first-strike capability by 1981.
- The U.S. will be forced to choose between surrender—or war!

These are some of the controversial conclusions of PEACE ENDANGERED by R. J. Rummel, professor of political science at the University of Hawaii. An analysis of international behavior and the strategic arms balance, this compelling book cannot be ignored by anyone interested in foreign affairs, détente, deterrence, or world peace. Dr. Rummel's thought-provoking conclusions, based on in-depth analysis and research, will have to be taken seriously even by the most devoted proponents of détente.

A selection of the Library of Political and International Affairs.

THE COMMITTEE OF ONE MILLION
"China Lobby" Politics, 1953-1971
STANLEY D. BACHRACK

Stanley Bachrack tells the story of the "Committee of One Million," a foreign policy interest group formed to pressure the American government *not* to recognize the People's Republic of China or accept its membership in the United Nations. Here is a disturbing account of a group which continued its self-imposed role as "watchdog" of American China policy up to the admission of the People's Republic of China in the UN in 1971. $14.95

SKEPTICAL SOCIOLOGY
DENNIS H. WRONG

This unique volume contains the finest and most enduring essays by Dennis H. Wrong, one of America's best-known sociologists. Among the topics discussed by this vital and stimulating thinker are the Freudian, Marxian, and Weberian heritages in sociology; social class in America; power and politics; and the sociology of the future. $14.95

PENSION PLANS AND PUBLIC POLICY
WILLIAM C. GREENOUGH and
FRANCIS P. KING

This new book examines in-depth the public policy issues surrounding the three major old-age income support systems in the U.S. today—Social Security, pension plans of private employers, and public employee retirement plans. Legislators, decision-makers in business, government and labor, and individuals covered under one or more of these retirement systems will appreciate this cogent analysis of how business and public policy can significantly affect the ability of pension plans to meet economic and social objectives in the post-ERISA era. $15.00

Timely new books...

The Supreme Court and the Commander in Chief

By CLINTON ROSSITER. With an introductory note and additional text by RICHARD P. LONGAKER. This classic study of presidential power is once again made available with the reissue of this book in a new, expanded edition. New material brings the book up to date, covering vital events of the past 25 years. Cloth, $15.00; Paper, $3.95

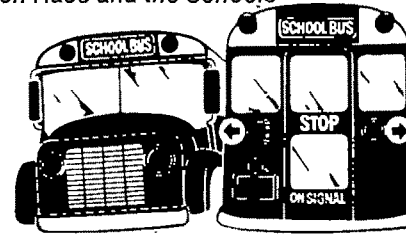
Political Violence

By TED HONDERICH. *Is political violence justifiable?* Taking a philosophical rather than an activist view, Ted Honderich deals with moral and philosophical arguments that have been offered for and against political violence. He offers an elegantly written, lively critique of certain presuppositions and inconsistencies of liberal-democratic thinking about political violence. Cloth, $7.95

Energy Supply and Government Policy

Edited by ROBERT J. KALTER and WILLIAM A. VOGELY. In fourteen essays written from different perspectives, nationally known specialists offer perceptive analyses of our energy-supply problems and realistic proposals for solving them.
Cloth, $18.50; Paper, $5.95

America as an Ordinary Country



U.S. Foreign Policy and the Future

Edited by RICHARD ROSECRANCE. "Timely and forceful....Knowledgeable, temperate and lucidly written, the essays range from *detente* and multinational corporations to the European Community and the Far East. A constructive international effort that deserves a wide readership."—*Publishers Weekly.* Cloth, $9.75

Disaster by Decree

The Supreme Court Decisions on Race and the Schools

By LINO A. GRAGLIA. This provocative book takes a sharply critical view of the Supreme Court rulings that led to forced busing. "A telling critique of the difficulties inherent in our major social and, of course, legal dilemma."—*Library Journal.* "An acute analysis of ...the most important decisions that the Court has composed in this century."—*Philip B. Kurland, University of Chicago.*
Cloth, $11.50

CORNELL UNIVERSITY PRESS ITHACA AND LONDON

Students, professors, and those interested in the study of politics and government are invited to become members of the AMERICAN POLITICAL SCIENCE ASSOCIATION.

JOIN APSA

Membership includes:

The American Political Science Review—quarterly journal of scholarly articles and book reviews in political science;

PS—quarterly journal of association news and articles of professional concern;

DEA News—quarterly newspaper on educational materials and methods;

Opportunity to register in the APSA Personnel Service—currently lists the largest number of political science teaching and research positions.

Attend the APSA Annual Meeting, September 1-4, 1977, Washington, D.C.

PRAEGER SPECIAL STUDIES

American Government and Politics Today
Second Edition

Charles P. Sohner, El Camino College

Covering national and state government, this text emphasizes those aspects of government which personally concern the potential voters in your class—civil rights and political participation. In the new Sohner, you'll find an even more readable text for your students in addition to an exciting new chapter that introduces material on social, economic, and foreign policy. The revision includes additional material on population shifts, church-state relations, ethnic politics, domestic spying, impeachment, and recent developments in other areas. Instructor's Manual containing test questions and summaries of topics in each chapter available.

January 1976, 385 pages, illustrated, paper, approx. $7.50

A Rationale for Innovation . . .

University Press of America presents a new concept in academic publishing that addresses directly two of this industry's foremost challenges:

The demands of a volatile environment.

As curriculums require more frequent revisions due to advances in the social and technical sciences, the traditional text, with its lengthy gestation period, can become quickly outdated.

The needs of a competitive academic profession.

Due to conventional processes that are becoming ever more costly, the traditional publishing industry no longer affords adequate opportunity for deserving professors to become published.

An Innovative Alternative.

The University Press of America's new concept is a vastly simplified approach to publishing, developed by academics, that effectively counters these growing challenges.

Its acceptance is best evidenced by the more than 100 new University Press of America titles to be found in a growing number of respected colleges and universities.

For complete details, including titles now available in the various disciplines, please write: James E. Lyons, Editor-in-Chief, University Press of America, 4710 Auth Place S.E., Washington, D.C. 20023– or phone (301) 899-9600.

International Arms Control

Issues and Agreements

Edited for The Stanford Arms Control Group by John H. Barton & Lawrence D. Weiler. This is an exhaustive analysis of national and international arms control: its history, philosophy, cultural context, technology, economic and political ramifications, achievements, and future prospects. The book will assist the general reader in understanding and forming intelligent opinions on such issues as the role of doctrine in the military, difficulties posed by rapidly changing technology, and the value and limitations of arms control as a way to prevent war. An appendix contains the text of eighteen major arms control agreements, and the volume concludes with discussion questions and suggestions for further reading. Cloth, $18.50; paper, $12.95

Holistic Thought in Social Science

D. C. Phillips. This book is a highly readable synthesis and critical examination of the character, history, and utility of holism ("A part cannot be understood in isolation from the whole"), especially as seen in its long conflict with the mechanistic or analytic method of viewing reality. After identifying the points at issue, the author examines holism as manifested in various social scientific systems of thought, notably general systems theory, structuralism, functionalism, and Gestalt psychology. He concludes that "the analytic or mechanistic method . . . is such a moderate and reasonable position that no scientist, not even a holist, can avoid putting it into practice. By contrast, holism—taken seriously—is an eminently unworkable doctrine." $8.50

Stanford University Press

Thomas Y. Crowell Company
1977

Political Reform

Compelling . . . Original . . . Realistic . . .

William J. Crotty
Northwestern University

For a number of years, issues of political reform have been at the forefront of our politics, disrupting old alliances and fostering new ones. Much furor has arisen over the three areas that Professor Crotty, a widely known student of our political system, brilliantly discusses in his important new book. They are, in order, **voter registration, campaign finance,** and **political parties and the nominating system.**

The approach is appropriately historical in part. Equally important are Crotty's evaluation of current proposals and his own recommendations for specific reforms placed in the broad context of evolving change within the American democratic experiment.

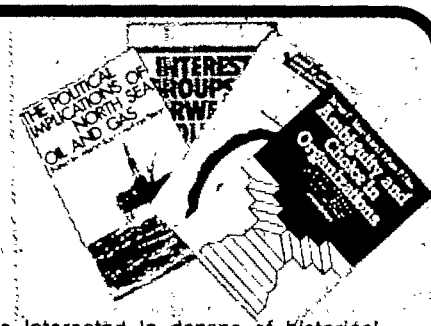
Illustrative material culled from the Watergate scandals shows us how deep, serious, and urgent our problems are.

American Legislative Processes

Behavioral... Comprehensive... Empirical...

Jack R. Van Der Slik
Southern Illinois University

How do legislators interact with the public, the political system, and each other to form policy? To answer this and related questions, Van Der Slik looks at the interrelationships among legislatures and legislators, the people, other actors and institutions in the society, and foreign political systems. Not content with analyzing decision making and intralegislative behavior at only the national level, Van Der Slik includes material on state and local legislatures as well. He treats his subject matter empirically—what legislators are like, how they make decisions, and how they organize themselves. Van Der Slik writes for students: he uses jargon-free, clear, readable English.



Don't overlook . . .

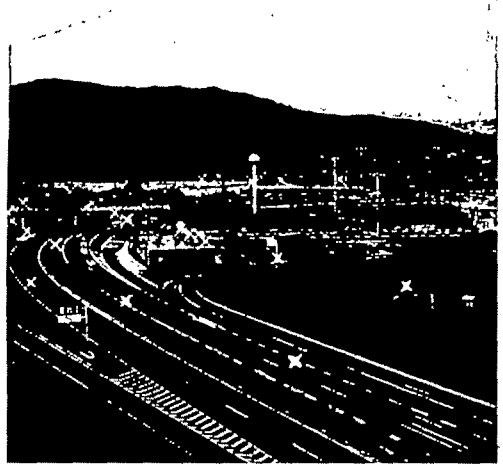
Japan: The Paradox of Progress

edited by Lewis Austin

The essays in this interdisciplinary volume examine the effects of rapid change on the character of Japanese society. Augmenting description with analysis and prediction, they sketch a composite portrait of a country in which old and new coexist, sometimes ironically. The discussion of Japan's experience suggests hypotheses about the future of advanced industrial society in general. $20.00



The Donegal Mafia

An Irish Political Machine

Paul M. Sacks

"This is the first study which analyzes contemporary Irish politics using the techniques of contemporary political science. An interesting and thoughtful study."
—Richard Rose

"An important contribution to the general study of machine politics and a valuable corrective to certain prevailing assumptions."—Conor Cruise O'Brien $15.00

Rural Responses to Industrialization

A Study of Village Zambia

Robert H. Bates

"Bates handles a wide range of fundamental problems concerning the place of rural society in political development. In particular, he connects the socioeconomic with the political and governmental in a way thoroughly unprecedented. Nothing comparable to the richness of Bates's data can be found in any extant study I'm aware of. A major breakthrough."—Martin Kilson $20.00

The Moral Economy of the Peasant

Rebellion and Subsistence in Southeast Asia

James C. Scott

Demonstrates that the fear of food shortages explains many otherwise puzzling technical, social, and moral arrangements in peasant society. Using lower Burma and Vietnam as examples, Scott shows how the transformations of the colonial era systematically violated the peasants' "moral economy" and created a situation of potential rebellion. $15.00

Yale University Press **New Haven and London**

From Halsted Press,

A Division of John Wiley & Sons, Inc.

WEST GERMANY:
An Introduction
By Gunther Kloss, University of Manchester.
1976 180 pp. $19.75
Provides a wealth of statistical material, integrated with clear narrative and analysis.

New Concepts in Poli Sci from DORSEY

available March

MANAGING THE PUBLIC SECTOR

Grover Starling, University of Houston (Clear Lake City)

Completely new, this practitioner-oriented text blends relevant theory with how-to-do-it techniques drawn from an exciting variety of sources. It provides a coherent, up-to-date, and highly readable overview of public administration.

available February

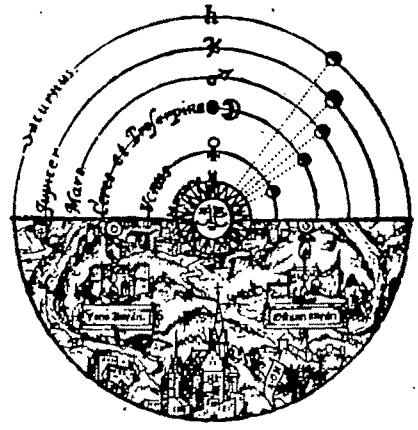
COMPARATIVE POLITICS: Notes and Readings, Fifth Edition

Edited by **Roy C. Macridis,** Brandeis University, and **Bernard E. Brown,** City University of New York (Graduate School and Lehman)

This classic reader has been expanded and updated, 50 per cent of the material in this edition is new. The authors provide the best presentation of the basic building blocks in the systematic study of comparative politics. **(paperbound)**

available March

COMPARING PUBLIC POLICIES: United States, Soviet Union, and Europe



Richard L. Siegel and **Leonard B. Weinberg,** University of Nevada (Reno)

Presents a comprehensive study of the sources, content and results of government policy in the United States, Soviet Union, and six European countries. The text uses a dual organizational framework: (a) distributive, regulative, and extra-active policies, and (b) welfare, warfare, and post-industrial policies. **(paperbound)**

Examination copies for adoption consideration available on request; please indicate course title and text presently used.

UTOPIA AND REVOLUTION
Melvin J. Lasky

In this remarkable intellectual history, Lasky charts five centuries of confrontation between visions of utopia and movements toward violent social change.

736 pages Cloth $29.95 to 12/31/76
$35.00 thereafter

LAW, LEGISLATION AND LIBERTY
Volume 2: The Mirage of Social Justice
Friedrich A. Hayek

Hayek argues in the second volume of his comprehensive three-part study of law and liberty that the unexamined pursuit of "social justice" will contribute to the erosion of personal liberties.

240 pages Cloth $10.00

THE PEASANTS OF THE MONTES
The Roots of Rural Rebellion in Spain
Michael R. Weisser

Through wide-ranging and imaginative scholarship, Weisser shows that rural Spanish anarchism was not a reaction to modernization, but a search for an alternative to the benefits of urban life.

168 pages Cloth $11.50

The Grand Strategy of the Roman Empire

From the First Century A.D. to the Third

Edward N. Luttwak

"A wide-ranging historical analysis of Roman strategy and the changing patterns of Roman statecraft — including both intriguing analogies and suggestive contrasts to the evolving international position of the United States." — *James R. Schlesinger, Former Secretary of Defense*

Edward N. Luttwak is a professional defense analyst who has served as a consultant to the secretary of defense. In the light of his knowledge of modern strategic analysis, he here undertakes the first systematic and sustained investigation of Roman strategy during the period of imperial autocracy. Of great sophistication, the strategies of the empire are still eminently worth studying, he believes. The Romans undoubtedly had a genius for governance that was expressed most of all in their very subtle and economical use of military force. $12.95

America's Mass Media Merchants

William H. Read

A seasoned newsman charts the rise of the American mass media and examines the implications of their global penetration. He documents in detail the transnational development of AP and UPI, the *New York Times* and the *Washington Post-Los Angeles Times* news services, the *International Herald Tribune, Newsweek, Time,* and *Reader's Digest.* The international distribution of American movies and television programs is also scrutinized. But how the world came to love Lucy represents to many third world, Communist, and even Western countries a disturbing intrusion of American values into ethnic cultures. While sensitive to fears of "cultural imperialism," Read finds *information sovereignty* to be an unacceptable alternative to the *free flow* principle. His lively and argumentative book is the first contribution to the dialogue from a liberal, critical, but not anti-media stance. $12.50

Prelude to Power

The Parisian Radical Press, 1789-1791

Jack Richard Censer

The Parisian radical press was born of the turmoil of 1789, which spawned both the political journalists and the political factions. Treating the events from the perspective of popular culture, Censer provides an in-depth analysis of the influence of the press on the populace which will be of great interest to political scientists. He combines a quantitative measurement of ideas with an examination of the more impressionistic examples of press technique. $12.50

BUREAUCRACY AND THE MODERN WORLD

Victor A. Thompson (University of Florida)

This comprehensive text offers a moral or philosophical basis for organization without sacrificing the behavioral understanding gained in recent years. It sets forth the moral assumptions of modern institutions, especially those engaged in providing goods and services, both public and private.

1976 150 pages paper, $5.95

CORRUPTION IN THE AMERICAN POLITICAL SYSTEM

Larry L. Berg (University of Southern California), Harlan Hahn (University of Southern California), John R. Schmidhauser (University of Southern California)

The purpose of this book is to assist students and other citizens in a reappraisal of the sources of—and reasons for—the systemic corruption found in the very structure of American politics.

1976 224 pages paper, $4.50

CONGRESSIONAL REFORM IN THE SEVENTIES

Leroy N. Rieselbach (Indiana University)

Indicating why Congress has not initiated public policy and suggesting that beneath this surface deference lies Congress' spirit of independence, this text discusses the first serious reform movement in the United States Congress in nearly three decades.

Painters and Politics

The European Avant-Garde and Society, 1900-1925

Theda Shapiro, *University of California-Riverside*

Based largely on unpublished materials, some unknown to art historians, PAINTERS AND POLITICS examines the political activities and social attitudes of a generation of avant-garde painters in Western Europe: the French Fauves and Cubists, the German Expressionists, and the Italian Futurists.

A landmark study for both art and social historians, this tastefully illustrated book will also fascinate anyone interested in avant-garde art and the European cultural scene.

1976 300 pages $15.00

Revolutions and Revolutionaries

Four Theories

Barbara Salert, *Washington University*

This study of revolution is a critical evaluation of four theories of revolution: rational choice theory, psychological theory, structural functionalism, and Marxism. These theories range from psychological explanations of motivations that induce people to join revolutionary movements to broad social explanations that focus on the socioeconomic and political conditions of societies that experience widespread violence. **1976 170 pages $12.95**

Power, Politics and Progress

Social Change in Rural Peru

William Foote Whyte, *Cornell University and* **Giorgio Alberti,** *University of Bologna*

A description and analysis of peasant movements and the politics of community and regional change in a developing nation. Based on a 10-year research program, the story is told in simple, straightforward language. The field research is then examined in order to draw general conclusions on peasant movements and revolutionary theory; conflict, cooperation and power in peasant communities, and planned change and political processes. The authors also show how to examine developments at the community level in the context of major national changes in the distribution of power. **1976 336 pages $15.00**

Hitler Among the Germans

Rudolph Binion, *Brandeis University*

HILTER AMONG THE GERMANS is a unique investigation of the psychodynamics of Adolf Hitler's rise and rule. The inner sources of Hitler's control over the German people are carefully uncovered as Binion traces the origins of Hitler's anti-Semitism and his extraordinary power to excite enthusiasm and disarm opposition. The wealth of new facts and insights presented in HITLER AMONG THE GERMANS makes it a landmark of historical scholarship.

"A remarkable book, notable in particular for its formidable scholarship and original research."
— John Toland **1976 224 pages $12.00**

Revised Second Edition of

AN INTRODUCTION TO AMERICAN GOVERNMENT

By KENNETH PREWITT & SIDNEY VERBA

The Second Edition of this widely used text is being revised for publication in February in order to incorporate political developments through the 1976 elections. Chapters 9, 10, and 11, on political parties and elections, congress, and the presidency, are completely rewritten to reflect campaign events and election results. The remainder of the book will stand as published last February.

AN INTRODUCTION TO AMERICAN GOVERNMENT is well-known for its unique focus on political capitalism which considers how capitalism has shaped American democracy. The book stresses the recurring patterns, structures, and processes that give meaning to political activity, providing students with a clear analytical understanding of the institutional and behavioral aspects of American government.

Tentative: 585 pages; $12.95. February 1977. ISBN 0-06-045281-1. Study Guide: $4.95; ISBN 0-045288-9. Instructor's Manual.

INSTRUCTIONAL RESOURCE MONOGRAPHS

A Guide to Library Sources in Political Science: American Government
by Clement E. Vose

Information and evaluation for teachers, librarians, and students on U.S. government publications, general reference books, library facilities, and their utilization.

PSI and Political Science: Using the Personalized System of Instruction to Teach American Politics
edited by Ralph B. Earle, Jr.

As a guide to the development of an alternative (to lecture and discussion sections) method of teaching and learning, this monograph is a collection of essays on the objectives, organization and impact of using the personalized system of instruction in political science. Examples are given on topics in American politics.

Simple Simulations
by Charles Walcott with Anne Walcott

A selective guide to the development, applicability and impact of simulations and games, with examples for the design of original role playing exercises.

Computer-Assisted Instruction in Political Science
edited by Jonathan Pool

A guide to the theory, design and application of computer-assisted instruction for interactive teaching and learning in political science. Examples from several subfields, including political philosophy.

U.S. Census Data for Political and Social Research: A Resource Guide
by Phyllis G. Carter

A guide to the acquisition—in print and on computer tape—and instructional application of U.S. Census Bureau data on: population and housing, governments, economy, Congressional districts. Also, answers to the exercises in the Students Manual.

U.S. Census Data for Political and Social Research: Students Manual
by Phyllis G. Carter

A guide and exercise book, student instruction in basic data analysis for solving problems on political and social questions, with references to data on population, housing, governments, and Congressional districts, gathered by the U.S. Census Bureau.

Critical Choices for Americans

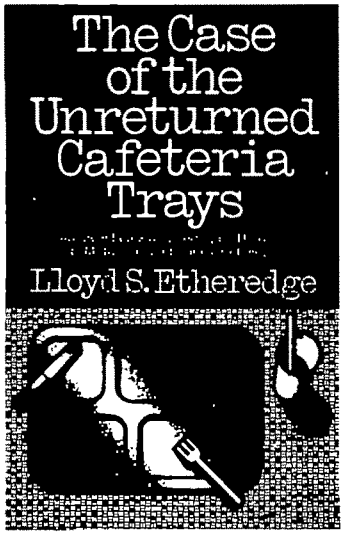
Critical Choices for Americans, a fourteen-volume work on urgent problems that face the United States and the world at the beginning of America's third century, will appear through 1976 and into 1977 under the imprint of Lexington Books.

A wide range of subjects is covered including: energy, the environment, and economics; population, food, and land use; raw materials; criminal justice and the law; education; and foreign relations and national defense. A major portion of the work concerns ideas about America, extensive analyses of different regions of the world, and the quality of life of communities and individuals.

The Commission on Critical Choices for Americans, brought together by Nelson A. Rockefeller in 1973, commissioned 128 of the best minds in the world to highlight alternatives facing America. Their subjects include energy, the environment, population, food, land use, criminal justice, education, defense, and extensive analyses of regions of the world.

About the series in general, **TIME Magazine** said:

"NEW STARTS FOR AMERICA'S THIRD CENTURY . . . What emerges from these essays is the sense that in nearly every important field, ideas that dominated for half a century or more are giving way. New notions are being pursued and older ideas, discarded earlier in the 20th century, are being re-examined . . . Different though the various views of human nature may be, the very use of the term implies that there is something permanent and irreducible in man and that his resistance to outside manipulation is a kind of triumph."



The books are:

Volume I	**Vital Resources. 288pp. $14.95**
Volume II	**The Americans: 1976. 400pp. $15.95**

Our Books in Political Science: *And what your colleagues are saying about them*

AMERICAN PUBLIC ADMINISTRATION:
Concepts and Cases
Carl E. Lutrin and Allen K. Settle

In this lively, issues-oriented basic text, case studies help illustrate the concepts and scope of public administration, the controversies, and the practical problems plaguing this nation's public servants.
1976. 392 pages. $12.95 cloth.

LUTRIN AND SETTLE PROVIDE A THOROUGH AND INTERESTING COVERAGE OF THE FIELD. I WAS QUITE IMPRESSED WITH THIS PRESENTATION. NORMALLY YOU SIMPLY LEAF THROUGH AN EXAMINATION TEXT, BUT I CAUGHT MYSELF READING THIS ONE. CASE STUDIES ARE QUITE APPROPRIATE AND WELL ORGANIZED AS WELL.
William R. Mangun, Salisbury State College, Maryland

THE SUPREME COURT AND CIVIL LIBERTIES POLICY
Richard C. Cortner

This text is an in-depth review of six seminal cases representing the most important fields in which the U.S. Supreme Court has enunciated significant civil liberties policies in recent years.
1976. 225 pages. $4.95 paper.

AN EXCELLENT BOOK THAT FILLS A MAJOR GAP BETWEEN CASEBOOKS AND SINGLE-ISSUE CASE STUDIES. IT IS WELL-WRITTEN, QUITE COMPREHENSIBLE TO THE AVERAGE STUDENTS. THE CASES USED ARE EXCITING TO THE STUDENT AUDIENCE
S. Eugene Clark, California State College at Bakersfield

WOMEN: A Feminist Perspective
Jo Freeman (ed.)

Edited by a political scientist, WOMEN is a collection of scholarly writings on women by women from a wide range of academic disciplines.
1975. 487 pages. $7.50 paper.

I think it's excellent. Freeman is one of the best scholars on women currently — if not the best. It is one of the few anthologies that is scholarly yet from a feminist perspective. Although my name is Freeman, she is not a relative. I just happen to admire her work a great deal.
Bonnie Cook Freeman, University of Texas

LATIN AMERICAN POLITICS: A Developmental Approach
Edward J. Williams and Freeman J. Wright

The authors provide fresh insight by analyzing the development of Latin America as a whole rather than taking the usual country-by-country approach, and address the sociological and economic questions that have affected its politics.
1975. 480 pages. $12.95 cloth.

I was particularly impressed by the lucid, readable writing style. The clear presentation of the developmental process provided in the opening chapter should be most helpful in "setting the scene". The essential historic background is clearly and concisely summarized. The developmental process in Latin America is fully and understandably presented
Louis G. Kable, University of Missouri — Columbia

INSIDE FOREIGN POLICY: The Department of State Political System and Its Subsystems
John H. Esterline and Robert B. Black

Drawing upon their 40 years of experience, the authors give an insider's view of struggles for power in Washington and our embassies abroad, contradicting the commonly held view that the importance of the State Department in foreign policy formulation has declined.
1975. 271 pages. $5.95 paper.

"Those who study the conduct of America's foreign affairs . . . will be exposed to sharp analysis and shrewd observations of the 'realities' seldom alluded to in the customary and more ponderously written text on foreign policy."
USIA WORLD, June '75

PUBLIC OPINION: Its Formation, Measurement, and Impact
Susan Welch and John Comer (eds.)

Written primarily from a political science perspective, this book analyzes the influence of the government, society, and the media on public opinion, and the impact public opinion has on policy making.
1975. 541 pages. $7.50 paper.

THIS IS A VERY DISTINGUISHED COLLECTION OF READINGS CONTAINING STUDIES AND THEORETICAL ARTICLES BY SOME OF THE MORE PRESTIGIOUS RESEARCHERS IN THE FIELD.
John Norton, Lebanon Valley College, Pennsylvania

THE UNEASY PARTNERSHIP: The Dynamics of Federal, State and Urban Relations
Richard D. Feld and Carl Grafton (eds.)

A practical analysis of urban problems: welfare, the environment, technology, and high education — how these problems impact on the federal system and vice versa.
1973. 322 pages. $5.95 paper.

LUCID PRESENTATION OF THE FEDERAL SYSTEM. A DEVELOPMENTAL VIEW OF GREAT USEFULNESS TO FIRST-TIME STUDENTS OF PUBLIC ADMINISTRATION.
Frances E. Winslow, Kean College, New Jersey

ROUSSEAU'S POLITICAL PHILOSOPHY

AN EXPOSITION AND INTERPRETATION

RAMON M. LEMOS

In his detailed analyses of *Discourse on the Origin and Foundation of Inequality among Men*, *Discourse on Political Economy*, and *The Social Contract*, Lemos refutes the claims of some critics that Rousseau's writings abound with obscurities and inconsistencies. By providing a detailed clarification of the development of the philosopher's political theory, the difficulties presented by the successive texts, and the apparent contradictions between them, the book presents Rousseau's work as an intelligible and coherent system of thought. 344 pages / $14.50

THE SHOTGUN BEHIND THE DOOR

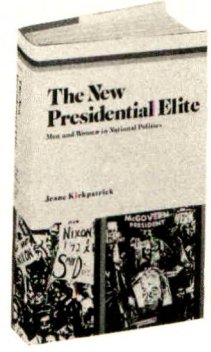
LIBERALISM AND THE PROBLEM OF POLITICAL OBLIGATION

PHILIP ABBOTT

Foreword by Russell Kirk

Plagued by the image of the state as a shotgun behind the door, the liberal has justified government by the only appeal available to him, prudence. Philip Abbott reformulates the liberal response to the problem of political obligation by accepting the initial premises of liberal ethical theory and the political impluses which emerge from it while discarding the theories of political obligation that have been attached to it.

"A very stimulating and timely work"—*Library Journal.*



"This is a well-written, stimulating, thoughtful essay. It is well worth the time invested in carefully reading it through"—*Virginia Quarterly Review.* 212 pages / $8.00

THE UNIVERSITY OF GEORGIA PRESS
ATHENS 30602

★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★★

". . . the most thorough and the most convincing study of the emergent elites of the 'new politics' that I have seen. . . . This study is an example of contemporary political science at its best."

—Nelson W. Polsby

The New Presidential Elite
Men and Women in National Politics

By **Jeane Kirkpatrick**

Professor of Political Science, Georgetown University

American politics, suggests the author of **The New Presidential Elite,** is being transformed in important and fundamental ways. She believes that a "new breed" of men and women are actively involved in the majority party, and that their motives, goals, ideals, and patterns of organizational behavior are different from those of the people who have dominated American politics in the past. This book provides an in-depth study of these new managers and the new politics they champion.

The New Presidential Elite is the first large-scale study of convention delegates in two decades. It is based on interviews with 1,300 delegates to the 1972 Democratic and Republican National Conventions and mail questionnaires completed by some 55 percent of the delegates. It deals with the political backgrounds and experience, the attitudes and perceptions, and the orientations toward issues, candidates, parties, and male-female roles of a large number of active political participants.

The study, which was funded jointly by Russell Sage Foundation and The Twentieth Century Fund, suggests that new political types and patterns of participation were present among the delegates to the 1972 Democratic convention. Jeane Kirkpatrick identifies women as one part of the new "presidential elite," and discusses their present role in American politics. She analyzes the social, cultural, psychological, and political characteristics of the women who have become active, and explores some of the potential consequences of their activity.

"I want to state as strongly as I possibly can my conviction that The New Presidential Elite *is one of the very few truly outstanding works I have ever read that genuinely meld the micro with the macro and the empirical with the theoretical. I believe its publication will constitute a major event in political science scholarship."*

—Austin Ranney

"The interview data are skillfully examined in the light of significant modes of political analysis, and I am sure that the richness of the result will be widely appreciated by social scientists, commentators and active political advisors of every kind."

—Harold D. Lasswell

1976. 606 pages. $20.00

Have you checked...
TIAA's new life insurance rates?

The traditional "best buy" in life insurance is now even better, and you'll be startled to find how little it costs to own all the family protection you need. To illustrate,

at *any* issue age below 35 for men and 40 for women, a $50,000 TIAA policy now costs less than $100; and $100,000 policies are under $180.

These are yearly net costs after current dividends (dividends not guaranteed) for policies issued on the popular 20-Year Decreasing Term plan. For exact information on this plan and what $50,000 or $100,000 immediate coverage would cost at your age,

Either telephone collect...
the TIAA LIFE INSURANCE ADVISORY CENTER at (212) 490-9000
and ask for an Insurance Counselor:

or send this coupon...
to receive information by mail.
In either case there are no strings attached and no one will call on you.

In the 1990's:

A World Federation Of Cultures

In this attempt to outline a "preferred world" for the end of this century, noted African scholar Ali A. Mazrui writes about a global culture that is tragically out of balance, that ignores most of the civilizations of the world and elevates only the Western heritage. If we are to move towards a better future, we must maintain the trend towards a world culture, making that culture less Eurocentric and more representative of the riches of the human race.

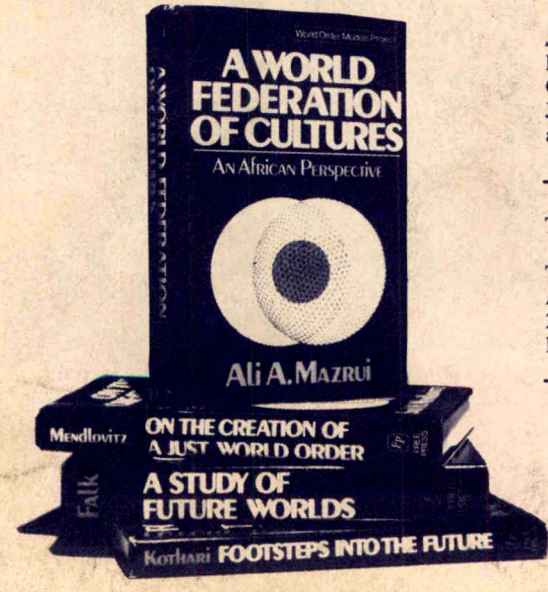
> "Ali A. Mazrui proposes . . . a world federation of cultures. There are to be five 'world languages' —English, French, Russian, Chinese and Arabic . . . Each country is to declare its allegiance to one of these five. Each schoolchild is to learn three languages—a world language, a 'regional' language, and a national or subnational language . . . The idea warrants serious discussion."
>
> —*Political Science Quarterly*

> "Makes the case that the human community might be better off if it could free itself from the domination of a Eurocentric world culture, and urges the establishment of a global political system that will represent people by cultures as well as power."
>
> —*The Humanist*

A world Federation of Cultures is the latest in a series of books produced by the World Order models Project of the Institute for World Order. WOMP is a five-year effort to bring together scholars from eight regions of the world to apply world order science to the current planetary predicament and to address the issues of militarism, famine, loss of freedom and ecological deterioration through a humane perspective. Of WOMP, *Foreign Affairs* wrote:

> ". . . The first fruits of the ambitious World Order Models Project of the Institute for World Order . . . Consciously highly normative, they present both a diagnosis of the present human condition and proposals for the radical transformation of global society . . . An important and obviously highly controversial series."

17 JUL 1978



Books in the series:
